ABSTRACT

The aim of this thesis is to study invariant algorithms for the domain of discrete orthogonal moments. The invariants are anisotropic scale and translation invariants, translation, rotation and scale invariants, and affine moment invariants. Due to the complexity of hypergeometric functions, existing invariant algorithms are slow. In addition, some of the features have poor classification performance and are highly sensitive to the noise. Therefore new sets of invariant algorithms have been proposed to resolve the above mentioned issues. Discrete Tchebichef moments are selected as the implementation platform of the proposed algorithms. To evaluate the performance of invariant algorithms, empirical studies have been carried out on large set of binary images which consist of numbers, English letters, symbols, Chinese characters and objects like animals, trees and company logos under noiseless and noisy conditions. The discriminative power of the features is studied using a set of very similar handwritten Chinese characters. Experimental results showed that the proposed invariant algorithms are superior in computational efficiency. The generated features from the proposed invariants in general, demonstrate improvements in classification performance in both noiseless and noisy conditions.

ABSTRAK

Tujuan tesis ini adalah untuk menguji algoritma takubahan bagi domain momen ortogonal diskrit. Ketakubahan yang dikaji adalah ketakubahan skala anisotropik dan penterjemahan, ketakubahan skala, putaran and penterjemahan, dan ketakubahan afin. Atas sebab kerumitan fungsi hipergeometrik, algoritma takubahan yang sedia ada adalah perlahan. Sesetengah ciri yang dihasilkan oleh algoritma takubahan tersebut adalah lemah dalam keupayaan pengelasan dan terlalu peka terhadap hingar. Atas sebab itulah, set baru algoritma takubahan diperkenalkan untuk menyelesaikan masalah-masalah tersebut. Momen diskrit Tchebichef dijadikan asas pelaksanaan algoritma-algoritma yang dicadangkan. Bagi mengesahkan keupayaan algoritma-algoritma, kajian empirik telah dilaksanakan terhadap pelbagai imej termasuk nombor, huruf Inggeris, huruf Cina, dan objek-objek seperti binatang, pokok dan logo syarikat dibawah keadaan tanpa hingar dan keadaan yang hingar. Kuasa pembezaan terhadap ciri-ciri yang dihasilkan telah dikaji dengan menggunakan set penulisan huruf Cina yang berdekataan. Keputusan eksperimen menunjukkan algoritma takubahan yang diperkenalkan adalah unggul dalam kecekapan pengiraan. Ciri-ciri yang dihasilkan secara amnya menunjukkan penambahbaikan dari aspek pengelasan dalam keadaan tanpa hingar dan keadaan hingar.

ACKNOWLEDGEMENTS

This thesis would never have been written without the contributions from a large number of people. In particular I want to thank the following persons:

I owe my greatest gratitude to my supervisor Professor Dr. Ong Seng Huat for his constant support and guidance throughout the course of this work. His patient, wisdom, and encouragement has made this thesis possible.

I am indebted to my co-supervisor Professor Dr. Raveendran Paramesran for his motivation, encouragement, guidance, and support especially during the most critical stage of my study.

For the examiners, I took to heart their perceptive and unsparing criticisms of the original manuscript, and the thesis has been benefited greatly from their insights.

I would like to extend my sincere gratitude to Associate Professor Dr. Ho Chin Kuan, Dean of Faculty of Computing and Informatics, Multimedia University, and Professor Dr. Mohd Bin Omar, Head of Institute of Mathematical Sciences, University of Malaya who have been instrumental in my pursuit.

The special thank goes to my old friend, Dr. Wong Wai Kuan who takes pain in proof reading this thesis.

I would like to express my appreciation to my friends and colleagues, especially Ms. Lim Siew Ling, Ms. Lim Lian Tze, Dr. Yap Pew Thian, Dr. Ting Choo Yee, Dr. Wong Chee Onn and Dr. Chua Kuan Chin for their help and encouragement.

My deepest gratitude goes to my family for their persistent love and support throughout my life. I am indebted to my wife Ms. Ng Chin Chin for her care, love and support. I am indebted to my parents for all the trouble they took to ensure we get the best in our life.

CHAPTER 1

OBJECTIVES, SCOPES AND CONTRIBUTIONS

Moment invariants have a long history early before the era of computer. It probably originated from the theory of algebraic invariants studied by German mathematician David Hilbert in the nineteenth century (Hilbert & Sturmfels, 1993). The moment invariants were first introduced to the field of image analysis by Hu (1962). Since then numerous works have been devoted to the various improvements and generalizations of Hu's moments (Reiss, 1991; Li, 1992; Flusser & Suk, 1993; W.-H. Wong, Siu, & Lam, 1995). However the geometric moments suffered from a high degree of information redundancy and the higher order moments are sensitive to noise. Since then several approaches have been taken to overcome these problems. Flusser has proposed a method to derive the independent set of geometric moment invariants of any order (Flusser, 2000, 2002). However this does not solve the noise sensitivity issue of higher order moments. On the other hand, continuous orthogonal moments namely Legendre and Zernike moments were introduced to resolve the issue of information redundancy (Teague, 1980). This is followed by the introduction of discrete orthogonal moments to resolve the issue of continuous moment integration approximation (Mukundan, Ong, & Lee, 2001). Since then several invariant algorithms have been proposed for the family of discrete orthogonal moments (Yap, Raveendran, & Ong, 2003; Goh, Chong, Rosli, Fazli, & Sim, 2009; Zhu, Xia, Luo, & Coatrieux, 2007c; H. Zhang, Dai, Sun, Zhu, & Shu, 2010; H. Zhang et al., 2011). However the algorithms are numerically inefficient mainly due to the complexity of hypergeometric functions involved. From our study, several algorithms also suffered from the noise sensitivities and poor discriminative power in classification. Therefore new sets of algorithms are proposed in this thesis to resolve the above mentioned issues.

1.1 Objective

This thesis aims to solve problems related to invariant algorithms in the domain of discrete orthogonal moments. The invariant algorithms involved are anisotropic scale and

translation (AST) invariants, translation, rotation and scale (TRS) invariants, and affine invariants. Due to complexity of the hypergeometric functions, the invariant expressions are complicated and numerically inefficient. Thus new recurrence relations have been derived for fast computations of the invariant descriptors. Furthermore, the normalization parameters of existing invariants are commonly determined using moments like the geometric moments and complex moments. To do so, the moments need to be recalculated again from the given image, or converted from the discrete orthogonal moments. This has created additional overhead on numerical computations. More importantly, some of the parameters are inappropriately estimated which severely affected the classification performance. Therefore new sets of normalization schemes based on the discrete orthogonal moments have been derived. In this study, the proposed features are compared with current existing features in terms of classification performance under noiseless and noisy conditions. The discriminative power of the features is evaluated using a set of hand-written very similar Chinese characters. As the study focuses on invariant algorithms, Tchebichef moments are selected as the implementation platform for all the above mentioned invariants. This is mainly due to the popularity and simplicity of Tchebichef basis functions. In addition, being the global features descriptors, the kernel of Tchebichef moments has a unit weight function. The invariants can be accurately derived from the original Tchebichef moments without being affected by inverse transform problems of the weight function.

1.2 Scope and Organization

The study examines the invariants of discrete orthogonal moments, both in theory and applications in image classifications. Chapter 2 provides a brief overview on moments, invariants, and some classification algorithms that are used in experiments. Chapter 3 to Chapter 6 illustrate the invariant algorithms for various forms of deformations. As the invariant algorithms are rather independent, each of the chapters (Chapters 3-6) is almost self-contained and can be read separately. The following is the summary of the contents of the chapters.

- **Chapter 2: Introduction to Moment Invariants and Image Classification**

In this chapter an overview is given on continuous and discrete moments. They are

geometric, Legendre, Tchebichef, Krawtchouk and Hahn moments. A brief introduction to the four main classifiers used in the experiments that is Euclidean distance algorithm, linear discriminant analysis, quadratic discriminant analysis and support vector machine are also provided.

- **Chapter 3: Fast Computation of Anisotropic Scale and Translation Invariants for Tchebichef Moments Using Algebraic Cancellation Approach.**

In this chapter the anisotropic scale and translation invariants of Zhu et al. (2007c) is reviewed. This is followed by the proposal of two new algorithm for fast computation. The first algorithm uses an indirect approach in which the invariant descriptors are calculated indirectly from geometric moments. This method also indicates a strong correlation between invariant descriptors by Zhu et al. (2007c) and geometric moments. In the latter approach, the features are directly computed from Tchebichef moments using the newly proposed recurrence relations. Experimental results show both algorithms are numerically stable and exhibit high numerical efficiency when compared with the current methods.

- **Chapter 4: Anisotropic Scale and Translation Invariants for Tchebichef Moments using Image Normalization Technique**

In this chapter the anisotropic scale and translation invariants proposed by Liu, Zhu, and Li (2011), and Goh et al. (2009) are reviewed. Both are based on methods of image normalization. However their approaches are found to be numerically inefficient. Furthermore, both of the normalization algorithms propose to use the origin as the centroid for their canonical forms which lead to ambiguities regarding the orthogonality of transformed moments. For that a new set of recurrence relations has been derived for fast computation of the invariant descriptors. To have features with better discriminative power, the centre of symmetry for the basis function is selected as centroid for the canonical image. To suit the requirements of different classification systems, three new normalization schemes based on Tchebichef moments have been proposed. The ambiguities of the transformation for the proposed normalization schemes have been solved theoretically. Empirical studies showed that the proposed algorithms are numerically efficient, and the generated features

are robust to noise and have better discriminative power.

- **Chapter 5: Translation, Rotation and Scale Invariants for Tchebichef Moments**

In this chapter the translation, rotational and scale invariants proposed by Yap et al. (2003) and the translation and rotation invariants proposed by H. Zhang et al. (2010) have been reviewed. Yap et al. (2003) derived the invariant descriptors indirectly using modified geometric moments. In the event that the image is not available, the method is not usable. On the other hand invariants of H. Zhang et al. (2010) are highly numerically inefficient. Therefore a new set of recurrence relations has been derived for fast computation of the invariant moments. This comes together with a new set of normalization schemes based on Tchebichef moments for determination of normalization parameters. Empirical studies confirm the newly proposed algorithm is numerically efficient and provides better classification performance.

- **Chapter 6: Affine Tchebichef Moment Invariants using Image Normalization**

In this chapter new affine Tchebichef moments invariants have been proposed by using the decomposition of seven single variable transformations proposed by Flusser, Suk, and Zitová (2009). These are simplified to four transformations: translation, rotation, and scale transformation, stretch transformation, second rotation transformation and reflective transformation. A new set of normalization scheme based on Tchebichef moments has been proposed to estimate the normalization parameters. Four distinct normalization schemes have been derived for second rotation transformation to handle symmetric patterns with 1-fold symmetry up to 4-fold symmetry, respectively. In an experiment, a set of non-symmetric patterns and a set of symmetric patterns (up to 4-fold symmetry) are used, all patterns have been accurately normalized to their canonical form without any ambiguity.

1.3 Contribution

In this section original and novel work in this thesis is listed:

- **Chapter 3**

The main contribution of this chapter is the study on how a complicated algorithm

can be simplified by using the property of orthogonal moments. With this understanding, a new recurrence relation has been derived for fast computation on the current invariants. A connection between anisotropic scale and translation invariants of Zhu et al. (2007c) and geometric moments is an important finding indicating a strong correlation between the two features.

- **Chapter 4**

The main contribution of this chapter is the implementation of the fast computation algorithms using recurrence relations. The use of the centre of symmetry as reference coordinate for the centroid of canonical images, is crucial in preserving the features' discriminative power. The derivation of three new scale normalization schemes for anisotropic scale and translation invariants and the uniqueness for the inverse transformation, enabled the Tchebichef moments based classification system to adopt new normalization scheme easily.

- **Chapter 5**

The main contribution of this chapter is the generalization of the recurrence formula from anisotropic scale and translation invariants to much larger problems - the affine moments invariants. The new normalization schemes for translation, scale and rotation Tchebichef moments invariants are novel as they are capable of resolving the ambiguities arising from the normalization process. With that, the features will have better discriminative power and higher level of noise resistance.

- **Chapter 6**

The main contribution of this chapter is the successful derivation of the affine Tchebichef moments invariants. It works accurately for non-symmetric patterns as well as symmetric patterns up to fourfold symmetry. In addition, all the normalized parameters are determined from Tchebichef moments accurately without ambiguity. Together with fast computation algorithms in Chapter 5, computationally fast and accurate affine Tchebichef moment invariants have been derived.

CHAPTER 2

INTRODUCTION TO MOMENT INVARIANTS AND IMAGE CLASSIFICATION

2.1 Moments

Moments are quantitative measures used to characterize a function and to capture its significant features. Mathematically, moments are simply projections of a function onto a set of polynomial basis. It has a long history and has been widely used in areas such as statistics and engineering. In statistics, it has been used for description of the shape of probability density function. In the field of image analysis, moments are used as shape descriptors of images. It has been successfully applied in various areas, like in aircraft and ship classification by Dudani, Breeding, and McGhee (1977), Belkasim (1991), Zvolanek (1981), characters recognition (Khotanzad & Yaw, 1990; Flusser & Suk, 1994a; Liao & Lu, 1997), data compression (Hsu & Tsai, 1993), template matching and registration of satellite images by Goshtasby R. Y. Wong and Hall (1978), (1985), Flusser and Suk(1994b).

Definition 2.1.1. In general, an $(m + n)^{\text{th}}$ —order moment, $M_{n,m}(f)$ for an image $f(x, y)$, is defined as

$$M_{n,m}(f) = \iint_S b_{n,m}(x, y) f(x, y) dx dy, \quad m, n = 0, 1, 2, \dots \quad (2.1)$$

where $b_{n,m}(x, y)$, is polynomial basis function defined on S . The parameter f at the left hand side of (2.1) is omitted if there is no danger of confusion.

2.1.1 Geometric Moments and Their Shape Representation

In the field of image analysis, the first significant paper on geometric moment invariants was by Hu (1962). In the paper, the affine geometric moment invariants based on the theory of algebraic invariants were introduced to the image processing community. Due to the simplicity of the geometric moments the proposed invariants are one of the most

popular and widely used features in the classification systems to date. The basis function of geometric moment is $b_{k,j}(x,y) = x^k y^j$, and this leads to

$$m_{k,j} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} x^k y^j f(x,y) dx dy \quad (2.2)$$

Low order geometric moments represent different spatial characteristics of the image. $m_{0,0}$ is known as the mass of the image.

The first order moments $m_{1,0}$ and $m_{0,1}$ denote the intensity moment about the x -axis and y -axis of image, respectively. The center of gravity or centroid (\bar{x}, \bar{y}) is

$$\bar{x} = \frac{m_{1,0}}{m_{0,0}}, \text{ and } \bar{y} = \frac{m_{0,1}}{m_{0,0}} \quad (2.3)$$

It is always convenient to evaluate the moments independent of the pattern position. This can be achieved by having the origin transformed to the centroid of the image. The moments computed with respect to the intensity centroid are called central moments

$$\mu_{n,m} = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} (x - \bar{x})^n (y - \bar{y})^m f(x,y) dx dy \quad (2.4)$$

The second order moments $\{m_{2,0}, m_{1,1} \text{ and } m_{0,2}\}$, are known as moments of inertia and they describe the “distribution of mass” with respect to the coordinate axes.

The radius of gyration with respect to x -axis and y -axis are respectively denoted as

$$\sqrt{\frac{m_{2,0}}{m_{0,0}}} \quad \text{and,} \quad \sqrt{\frac{m_{0,2}}{m_{0,0}}} \quad (2.5)$$

A principal axis of inertia of an image is defined as the two orthogonal axes, through the image centroid, having

$$m_{1,1} = 0. \quad (2.6)$$

Skewness is statistical measure of the degree of deviation from symmetry about the mean (Mukundan & Ramakrishnan, 1998). The coefficient of skewness of an image about the x -axis and y -axis are

$$S_x = \frac{\mu_{3,0}}{(\mu_{2,0})^{\frac{3}{2}}}, \quad (2.7)$$

$$S_y = \frac{\mu_{0,3}}{(\mu_{0,2})^{\frac{3}{2}}}. \quad (2.8)$$

However geometric moments suffer from a high degree of information redundancy, and the higher-order moments are sensitive to noise (Teh & Chin, 1988). To resolve the problems, the continuous orthogonal moments: Legendre moments and Zernike moments were later introduced by Teague (1980).

2.1.2 Continuous Orthogonal Moments

A set of basis polynomials $\{b_{n,m}(x,y)\}$ is said to be orthogonal if the elements satisfy the orthogonality condition (Szegö, 1939)

$$\iint_{\Omega} \omega(x,y) b_{n,m}(x,y) \cdot b_{p,q}(x,y) dx dy = \rho(m,n) \delta_{m,p} \delta_{n,q} \quad (2.9)$$

where $\omega(x,y)$ denotes the weight function (also called jump function), and $\rho(\cdot)$ is the squared norm. $\delta_{u,v}$ denotes the Kronecker delta, which equals to unity if $u = v$ and zero otherwise.

2.1.2 (a) Legendre Moments

From the Rodrigues representation, the n -degree Legendre polynomial (Koepef, 1998) is defined as

$$p_n(x) = \sum_{k=0}^n (-1)^{\frac{n-k}{2}} \frac{1}{2^n} \frac{(n+k)! x^k}{\left(\frac{n-k}{2}\right)! \left(\frac{n+k}{2}\right)! k!} \quad (2.10)$$

where $|x| \leq 1$ and $(n-k)$ is even.

The Legendre polynomials $\{p_n(x)\}$, is a complete orthogonal basis set on the interval $[-1, 1]$

$$\int_{-1}^1 p_n(x) p_m(x) dx = \frac{2}{2m+1} \delta_{n,m}. \quad (2.11)$$

Legendre polynomials have the three terms recurrence relation given by

$$p_{n+1}(x) = \frac{2n+1}{n+1} x p_n(x) - \frac{n}{n+1} p_{n-1}(x) \quad (2.12)$$

By having the basis $b_{n,m}(x,y) = p_n(x) p_m(y)$, the $(m+n)^{\text{th}}$ -order Legendre moment of $f(x,y)$ defined in the continuous space $[-1, 1] \times [-1, 1]$ is

$$L_{n,m} = \frac{(2n+1)(2m+1)}{4} \int_{-1}^1 \int_{-1}^1 p_n(x) p_m(y) f(x,y) dx dy, \quad n, m = 0, 1, \dots \quad (2.13)$$

Continuous moments such as geometric moments, Legendre moments, complex moments, and Zernike moments (Teague, 1980; Khotanzad & Hong, 1990) have been extensively studied and successfully applied in the area of image analysis. However as pointed out by Mukundan et al. (2001), the implementation of the moments have the following weaknesses

(A1) Numerical approximation of continuous integrals

The integral of continuous moments as stated by (2.2) and (2.13) are approximated by discrete summations. This not only leads to numerical errors but also inaccuracy in analytical properties such as invariance and orthogonality.

(A2) Large variation in the dynamic range of values

The basis often involved large power function. For example geometric moments of order $(n + m)$ on an image of size $N \times N$ pixels, the basis function $x^n y^m$ will therefore have large variation in the dynamic range of values for different orders of moments. Applications involving such moment functions will have to additionally include scale normalization to maintain equal weight for all the components. Furthermore it may be necessary to develop methods for avoiding numerical instabilities when the image size is large.

(A3) Coordinate space transformation

In general, orthogonal moments' basis, has domain completely different from the image coordinate space. For example, the basis of Legendre polynomials have domain in range $[-1, 1]$. The application of such orthogonal moments will require an appropriate transformation of the image coordinate space which will further increase the computational complexity.

2.2 Discrete Orthogonal Moments

To address the problems of continuous moments, different types of discrete orthogonal moments were proposed for image analysis. They are Tchebichef moments by Mukundan et al. (2001), Krawtchouk moments (Yap et al., 2003), Hahn moments by Yap, Raveendran, and Ong (2007), Dual Hahn moments (Zhu, Shu, Zhou, Luo, & Coatrieux, 2007b) and Racah moments by Zhu, Shu, Liang, Luo, and Coatrieux (2007a).

Let $S_2(N)$ be the 2D space in discrete domain

$$S_2(N) = \{(x, y) | 0 \leq x, y \leq N - 1, \quad x, y \in \mathbb{Z}\} \quad (2.14)$$

Suppose $\{b_n(x)\}$ denotes the discrete orthogonal polynomials (Erdelyi, Magnus, Oberhettinger, & Tricomi, 1953; Nikiforov, Suslov, & Uvarov, 1991) with weight $\omega(x)$, satisfying

the orthogonality condition

$$\sum_{x=0}^{N-1} \omega(x) b_n(x) b_p(x) = \rho(n, N) \delta_{n,p} \quad 0 \leq n, p \leq N-1 \quad (2.15)$$

where $\rho(\cdot)$ denotes the squared-norm, then for any bounded function $f(x, y)$, in $S_2(N)$,

$$f(x, y) = \sqrt{\omega(x)\omega(y)} \sum_{n=0}^{N-1} \sum_{m=0}^{N-1} M_{n,m} b_n(x) b_m(y) \quad (2.16)$$

where the coefficients $M_{n,m}$ is given by

$$M_{n,m} = \frac{1}{\rho(n, N) \rho(m, N)} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \sqrt{\omega(x)\omega(y)} b_n(x) b_m(y) f(x, y) \quad 0 \leq n, m \leq N-1 \quad (2.17)$$

and the squared-norm $\rho(n, N)$ can be obtained by

$$\rho(n, N) = \sum_{x=0}^{N-1} \omega(x) \{b_n(x)\}^2. \quad (2.18)$$

The discrete moments given in (2.17) completely eliminates the need to approximate the continuous integrals and does not require coordinate space transformation.

Table 2.1 gives a summary of the polynomials, the weights by which, the polynomials can be derived from monomials using Gram-Schmidt orthogonalization (Erdelyi et al., 1953; Arfken, 1985).

Table 2.1: Some important discrete orthogonal polynomials and their weight functions for image analysis. n denotes the degree of polynomials and $(p, \alpha, \beta, \gamma)$ are parameters attached to the respective polynomials

Name	Notation	space of x and n	$\omega(x)$
Tchebichef	$t_n(x)$	$[0, N-1]$	1
Krawtchouk	$k_n(x; p, N-1)$	$[0, N-1]$	$\binom{N-1}{x} p^x (1-p)^{N-1-x}$
Hahn	$h_n(x; \alpha, \beta, \gamma, N-1)$	$[0, N-1]$	$\binom{\alpha+x}{x} \binom{\beta+N-1-x}{N-1-x}$

As shown in Table 2.1, Tchebichef polynomials have a unit weight function which makes it an ideal candidate for extracting global features of images. Krawtchouk polynomials and Hahn polynomials are weighted by the binomial distribution and hypergeometric distribution, respectively. These give additional capabilities to the descriptors in focusing on particular location of image, and extract the corresponding local-structure information (Yap et al., 2003, 2007).

2.2.1 Discrete Tchebichef Moments

Tchebichef polynomials are first introduced by Chebyshev (1864) and rediscovered by Gram (1883). The discrete Tchebichef polynomial $t_n(x)$ is defined as

$$t_n(x) = (1-N)_n {}_3F_2(-n, -x, 1+n; 1, 1-N; 1) \quad n, x = 0, 1, 2, \dots, N-1 \quad (2.19)$$

where ${}_pF_q$ is the generalized hypergeometric function (Andrews, Askey, & Roy, 2004) given by

$${}_pF_q \left(\begin{matrix} a_1, a_2, \dots, a_p \\ b_1, b_2, \dots, b_q \end{matrix} \middle| z \right) = \sum_{k=0}^{\infty} \frac{(a_1)_k (a_2)_k \dots (a_p)_k}{(b_1)_k (b_2)_k \dots (b_q)_k} \frac{z^k}{k!}. \quad (2.20)$$

$(a)_k$ is the Pochhammer symbol that represents the rising factorial:

$$(a)_k = a(a+1)(a+2) \dots (a+k-1).$$

Tchebichef polynomials that satisfy the orthogonality condition (2.15) have squared-norm

$$\rho(n, N) = (2n)! \binom{N+n}{2n+1} \quad n = 0, 1, \dots, N-1 \quad (2.21)$$

where

$$\binom{n}{r} = \frac{n!}{r!(n-r)!}. \quad (2.22)$$

The three terms recurrence relation is denoted as

$$nt_n(x) - (2n-1)(2x-N+1)t_{n-1}(x) + (n-1)(N^2 - (n-1)^2)t_{n-2}(x) = 0 \quad n = 2, 3, \dots, N-1. \quad (2.23)$$

However the set of polynomials $t_n(x)$ grow by N^n , which have caused numerical instability in computation (Mukundan et al., 2001). To overcome the shortcoming, scaled Tchebichef polynomials are used to compute the feature moments:

$$\tilde{t}_n^N(x) = \frac{t_n(x)}{\beta(n, N)} \quad (2.24)$$

where $\beta(n, N)$ denotes the scale factor independent of x . Suppose that $\beta(n, N) = \sqrt{\rho(n, N)}$, we get

$$\beta(n, N) = \sqrt{\frac{N(N^2 - 1)(N^2 - 2^2) \cdots (N^2 - n^2)}{2n + 1}}. \quad (2.25)$$

With that, the scaled Tchebichef polynomials have unit squared-norm which make it orthonormal.

From now on, orthonormal Tchebichef polynomials defined on the space $[0, N - 1]$, will be denoted as $\tilde{t}_n^N(x)$.

The $(n + m)^{\text{th}}$ -order Tchebichef moment $T_{n,m}$ for image $f(x, y)$ on the space of $S_2(N)$, is defined as

$$T_{n,m} = \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(x) \tilde{t}_m^N(y) f(x, y) \quad (2.26)$$

and the corresponding inverse moment transform is

$$f(x, y) = \sum_{n=0}^{N-1} \sum_{m=0}^{N-1} \tilde{t}_n^N(x) \tilde{t}_m^N(y) T_{n,m}. \quad (2.27)$$

The three-term recurrence relation for the Tchebichef polynomials, $\tilde{t}_n^N(x)$, can be expressed as

$$\begin{aligned} \tilde{t}_n^N(x) &= (x\tilde{A}_n^N + \tilde{B}_n^N)\tilde{t}_{n-1}^N(x) + \tilde{C}_n^N\tilde{t}_{n-2}^N(x), \\ n &= 2, 3, \dots, N-1, \quad x = 1, 2, \dots, N-1 \end{aligned} \quad (2.28)$$

and

$$\tilde{t}_0^N(x) = \frac{1}{\sqrt{N}} \quad (2.29)$$

$$\tilde{t}_1^N(x) = (x\tilde{A}_1^N + \tilde{B}_1^N)\tilde{t}_0^N(x) \quad (2.30)$$

where

$$\tilde{A}_n^N = \frac{2}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (2.31)$$

$$\tilde{B}_n^N = \frac{(1 - N)}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (2.32)$$

$$\tilde{C}_n^N = -\frac{(n-1)}{n} \sqrt{\frac{2n+1}{2n-3}} \sqrt{\frac{N^2 - (n-1)^2}{N^2 - n^2}}. \quad (2.33)$$

Both scaled and classical Tchebichef polynomials have symmetric property satisfying

$$\tilde{t}_n^N(x) = (-1)^n \tilde{t}_n^N(N-1-x). \quad (2.34)$$

From (2.34), the centre of symmetry for Tchebichef polynomials $\{\tilde{t}_n^N(x)\}$ is found to be at $\frac{N-1}{2}$.

Tchebichef moments can be effectively computed using (2.26) and (2.28) to (2.34). Due to discrete nature of the images, computation of Tchebichef moments are superior over continuous moments such as the Zernike and the Legendre moments. However computation of Tchebichef moments tends to exhibit numerical instabilities when the order of moments becomes large. This is mainly due to the cumulative errors caused by recursive computation of (2.28). The errors can be minimized by using the recurrence relation of Tchebichef polynomials $\tilde{t}_n^N(x)$ with respect to x (Mukundan, 2004)

$$\begin{aligned}\tilde{t}_n^N(x) &= \gamma_1 \tilde{t}_n^N(x-1) + \gamma_2 \tilde{t}_n^N(x-2) \\ n &= 1, 2, \dots, N-1; \quad x = 2, 3, \dots, N-1\end{aligned}\quad (2.35)$$

where

$$\gamma_1 = \frac{-n(n+1) - (2x-1)(x-N-1) - x}{x(N-x)} \quad (2.36)$$

$$\gamma_2 = \frac{(x-1)(x-N-1)}{x(N-x)} \quad (2.37)$$

and

$$\tilde{t}_n^N(1) = \left\{1 + \frac{n(1+n)}{1-N}\right\} \tilde{t}_n^N(0) \quad (2.38)$$

$$\begin{aligned}\tilde{t}_n^N(0) &= -\sqrt{\frac{N-1}{N+n}} \sqrt{\frac{2n+1}{2n-1}} \tilde{t}_{n-1}^N(0) \\ n &= 1, 2, \dots, N-1.\end{aligned}\quad (2.39)$$

2.2.2 Krawtchouk Moments

Krawtchouk polynomials are discrete orthogonal polynomials introduced by Mikhail Kravchuk (Krawtchouk, 1929a, 1929b). The polynomials are associated with binomial distribution. Following the definition given by Koekoek and Swarttouw (1998), the Krawtchouk polynomial $k_n(x; \alpha, \beta, N-1)$ is defined as

$$k_n(x; p, N-1) = {}_2F_1(-n, -x; -N+1; \frac{1}{p}) \quad (2.40)$$

where $n, x = 0, 1, 2, \dots, N-1, N > 1, p \in (0, 1)$ and ${}_2F_1$ is the hypergeometric function as defined in (2.20).

Krawtchouk polynomials $\{k_n(x; p, N-1)\}$ form a complete set of discrete basis functions with weight function

$$\omega(x; p, N-1) = \binom{N-1}{x} p^x (1-p)^{N-1-x} \quad (2.41)$$

and satisfy the orthogonality condition

$$\sum_{x=0}^{N-1} \omega(x; p, N-1) k_n(x; p, N-1) k_m(x; p, N-1) = \rho(n; p, N-1) \delta_{n,m} \quad (2.42)$$

where $n, m = 0, 1, \dots, N-1$ and

$$\rho(n; p, N-1) = (-1)^n \left(\frac{1-p}{p} \right)^n \frac{n!}{(-N+1)_n}. \quad (2.43)$$

The orthonormalized Krawtchouk polynomial $\bar{k}_n(x; p, N-1)$ is defined as

$$\bar{k}_n(x; p, N-1) = k_n(x; p, N-1) \sqrt{\frac{\omega(x; p, N-1)}{\rho(n; p, N-1)}}. \quad (2.44)$$

For simplicity, the orthonormalized Krawtchouk polynomial is denoted as Krawtchouk polynomial with $\bar{k}_n(x)$.

The $(n+m)^{\text{th}}$ -order Krawtchouk moment $Q_{n,m}$ for image intensity function $f(x, y)$ on space of $S_2(N)$, is defined as

$$Q_{n,m} = \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \bar{k}_n(x) \bar{k}_m(y) f(x, y) \quad (2.45)$$

and the corresponding inverse moment transform is

$$f(x, y) = \sum_{n=0}^{N-1} \sum_{m=0}^{N-1} \bar{k}_n(x) \bar{k}_m(y) Q_{n,m}. \quad (2.46)$$

The three-term recurrence relation of Krawtchouk polynomial, $\bar{k}_n(x)$, can be expressed as

$$\begin{aligned} \bar{k}_n(x) &= (x\bar{A}_n + \bar{B}_n) \bar{k}_{n-1}(x) + \bar{C}_n \bar{k}_{n-2}(x) \\ n &= 2, 3, \dots, N-1 \end{aligned} \quad (2.47)$$

and

$$\bar{k}_0(x) = \sqrt{\omega(x; p, N-1)} \quad (2.48)$$

$$\bar{k}_1(x) = \left[1 - \frac{x}{p(N-1)} \right] \sqrt{\frac{p(N-1)}{(1-p)}} \sqrt{\omega(x; p, N-1)} \quad (2.49)$$

where

$$\bar{A}_n = \frac{-1}{\sqrt{p(1-p)n(N-n)}} \quad (2.50)$$

$$\bar{B}_n = \frac{p(N-n) + (n-1)(1-p)}{\sqrt{p(1-p)n(N-n)}} \quad (2.51)$$

$$\bar{C}_n = -\sqrt{\frac{(n-1)(N-n+1)}{(N-n)n}}. \quad (2.52)$$

The symmetric property of Krawtchouk polynomial is

$$\bar{k}_n(x; p, N-1) = (-1)^n \left(\frac{1-p}{p} \right)^n \bar{k}_n(N-1-x; 1-p, N-1). \quad (2.53)$$

Krawtchouk polynomials are self-dual

$$\bar{k}_n(x; p, N-1) = \bar{k}_x(n; p, N-1). \quad (2.54)$$

2.2.3 Hahn Moments

The Hahn family of orthogonal polynomials were introduced by Chebyshev(1907) and rediscovered by Hahn(1949). According to Koekoek and Swarttouw (1998), Hahn polynomial $h_n(x; \alpha, \beta, N-1)$ is defined as

$$h_n(x; \alpha, \beta, N-1) = {}_3F_2(-n, n+\alpha+\beta+1, -x; \alpha+1, -N; 1) \quad (2.55)$$

$n, x = 0, 1, 2, \dots, N-1$

where $\alpha > -1$ & $\beta > -1$ or $\alpha < -N+1$ & $\beta < -N+1$, and ${}_3F_2$ is hypergeometric function as defined in (2.20).

Hahn polynomials $\{h_n(x; \alpha, \beta, N-1)\}$ form a complete set of discrete basis functions with weight function

$$\omega(x; \alpha, \beta, N-1) = \binom{\alpha+x}{x} \binom{\beta+N-1-x}{N-1-x} \quad (2.56)$$

and satisfy the orthogonality condition

$$\sum_{x=0}^{N-1} \omega(x; \alpha, \beta, N-1) h_n(x; \alpha, \beta, N-1) h_m(x; \alpha, \beta, N-1) = \rho(n; \alpha, \beta, N-1) \delta_{n,m} \quad (2.57)$$

where $n, m = 0, 1, \dots, N-1$ and

$$\rho(n; \alpha, \beta, N-1) = \frac{(-1)^n (n+\alpha+\beta+1)_N (\beta+1)_n n!}{(2n+\alpha+\beta+1)(\alpha+1)_n (-N+1)_n (N-1)!}. \quad (2.58)$$

The orthonormalized Hahn polynomial $\hat{h}_n(x; \alpha, \beta, N-1)$ is defined as

$$\hat{h}_n(x; \alpha, \beta, N-1) = h_n(x; \alpha, \beta, N-1) \sqrt{\frac{\omega(x; \alpha, \beta, N-1)}{\rho(n; \alpha, \beta, N-1)}} \quad (2.59)$$

For simplicity, the orthonormalized Hahn polynomial is denoted as $\hat{h}_n(x)$.

The $(n+m)^{\text{th}}$ -order Hahn moments $H_{n,m}$ for image $f(x,y)$ in space of $S_2(N)$, is defined as

$$H_{n,m} = \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \hat{h}_n(x) \hat{h}_m(y) f(x,y) \quad (2.60)$$

and the corresponding inverse moment transform is

$$f(x,y) = \sum_{n=0}^{N-1} \sum_{m=0}^{N-1} \hat{h}_n(x) \hat{h}_m(y) H_{n,m}. \quad (2.61)$$

The three-term recurrence relation of Hahn polynomial, $\bar{h}_n(x)$, can be expressed as

$$\begin{aligned} \hat{h}_n(x) &= (x\hat{A}_n + \hat{B}_n)\hat{h}_{n-1}(x) + \hat{C}_n\hat{h}_{n-2}(x), \\ n &= 2, 3, \dots, N-1 \end{aligned} \quad (2.62)$$

where

$$\hat{A}_n = -\sqrt{\frac{(2n-1+\alpha+\beta)(2n+1+\alpha+\beta)(2n+\alpha+\beta)^2}{(n+\alpha+\beta)(n+\alpha)(n+\beta)(n+\alpha+\beta+N)(N-n)n}} \quad (2.63)$$

$$\begin{aligned} \hat{B}_n &= \left[1 + \frac{(n-1+\alpha+\beta+N)(n-1+\beta)(2n+\alpha+\beta)(n-1)}{(2n-2+\alpha+\beta)(n+\alpha+\beta)(n+\alpha)(N-n)} \right] \\ &\quad \times \sqrt{\frac{(n+\alpha+\beta)(n+\alpha)(2n+1+\alpha+\beta)(N-n)}{(n+\alpha+\beta+N)(n+\beta)(2n-1+\alpha+\beta)n}} \end{aligned} \quad (2.64)$$

$$\begin{aligned} \hat{C}_n &= \sqrt{\frac{(n-1+\alpha+\beta+N)(n-1+\alpha)(n-1+\beta)(n-1+\alpha+\beta)}{(n+\alpha+\beta)(n+\alpha)(n+\beta)(n+\alpha+\beta+N)}} \\ &\quad \times \sqrt{\frac{(2n+1+\alpha+\beta)(2n+\alpha+\beta)^2(N+1-n)(n-1)}{(2n-3+\alpha+\beta)(2n-2+\alpha+\beta)^2(N-n)n}} \end{aligned} \quad (2.65)$$

and

$$\hat{h}_0(x) = \sqrt{\frac{(N-1)!}{(\alpha+\beta+2)_{N-1}}} \sqrt{\omega(x; \alpha, \beta, N-1)} \quad (2.66)$$

$$\begin{aligned} \hat{h}_1(x) &= \sqrt{\omega(x; \alpha, \beta, N-1)} \times \left[1 - \frac{xn(n+\alpha+\beta+1)}{(\alpha+1)(N-1)} \right] \\ &\quad \times \sqrt{\frac{(3+\alpha+\beta)(\alpha+1)(N-1)(N-1)!}{(\beta+1)(2+\alpha+\beta)_N}}. \end{aligned} \quad (2.67)$$

2.3 Spatial Deformation and Moments Invariants

In the real world, images acquired by image systems in remote sensing, astronomy and medicine are imperfect. Various factors like imaging geometry, lens motion, systematic and random sensor errors etc can cause the acquired image to be unrecognisable. In this thesis we focus mainly on the following three spatial deformations which are defined as:

(B1) Anisotropic Scale and Translation Deformation

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} a_1 & 0 \\ 0 & b_1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix} \quad (2.68)$$

where a_1, b_1 denote the scale coefficients, and a_3, b_3 are the spatial displacements of image in the direction of x -axis and y -axis, respectively.

(B2) Translation, rotation and scale Deformation

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = a \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix}. \quad (2.69)$$

where the four-parameter transformation, has a as the positive scaling factor, θ as the angle of rotation, a_3 and b_3 are the spatial displacements of image in the direction of x -axis and y -axis, respectively.

(B3) Affine Deformation

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} a_1 & a_2 \\ b_1 & b_2 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix} \quad (2.70)$$

which denotes the general linear transformation of spatial coordinates.

Anisotropic scale and translation invariants are commonly encountered in character recognitions systems where characters printed in different type of fonts differ in scale and the spatial displacement. This also occurred in handwritten characters where the characters are written in different sizes and spatial displacements. On the other hand, translation, rotation and scale deformation are usually encountered in various type of biometric systems like face, finger print and iris recognition systems where the acquired images will tend to have different size, orientation and spatial displacement. Affine deformation is the

generalization of the above two transformations which represents wide spectrum of the spatial deformation of the images.

The ability to recognize patterns that have been deformed in various ways is an important process in classification systems. Basically, there are three major approaches to solve this problem - brute force, image normalization and invariant features (Flusser, 2007; Flusser et al., 2009). Brute-force approach appeared to be the simplest. However exhaustive search on parametric space of all possible patterns including the degraded ones, is practically inapplicable. In the normalization approach, the objects are transformed into a certain standard form known as canonical form before being classified. This is very efficient in the stage of classification. However in object normalization, it is usually not so easy to solve the inverse problems uniquely without ambiguities. The invariant features approach, on the other hand, uses a set of measurable quantities called invariants that are insensitive to particular deformations and that provide enough discriminative power to distinguish objects belonging to different classes. This is one of the most popular method. However invariants to a certain extent might also weaken the classification performance. Hence a trade off between invariance and discriminative power is a very important task in features based object recognition.

A function I is invariant of a particular deformation D on image f if

$$I(f) = I(D(f)) \quad (2.71)$$

On the other hand, a moment function $I_{n,m}$ is invariant of deformation D of image f if

$$I_{n,m}(f) = I_{n,m}(D(f)) \quad (2.72)$$

2.4 Image Classification

Models of data with a categorical response are called classification. A classifier is built from training data, for which classification is known. The classifier assigns new test data to one of the categorical levels of the response.

In this thesis the following classifiers will be used to evaluate the performance of invariant features:

(C1) Euclidean distance classifier,

(C2) Linear discriminant analysis (LDA),

(C3) Quadratic discriminant analysis (QDA), and

(C4) Support vector machine (SVM)

2.4.1 Euclidean Distance Classifier

The square of Euclidean distance classifier (Webb, Copsey, & Cawley, 2011) is defined as

$$d(\tilde{\mathbf{V}}_s, \tilde{\mathbf{V}}_t^{(k)}) = \sum_{j=1}^J (\tilde{v}_{s,j} - \tilde{v}_{t,j}^{(k)})^2 \quad (2.73)$$

where $\tilde{\mathbf{V}}_s = \begin{pmatrix} \tilde{v}_{s,1} \\ \tilde{v}_{s,2} \\ \vdots \\ \tilde{v}_{s,T} \end{pmatrix}$ and $\tilde{\mathbf{V}}_t^{(k)} = \begin{pmatrix} \tilde{v}_{s,1}^{(k)} \\ \tilde{v}_{s,2}^{(k)} \\ \vdots \\ \tilde{v}_{s,T}^{(k)} \end{pmatrix}$ are the J -dimensional scaled feature vectors of unknown sample and the scaled training vector of class k , respectively. The scaled

tors of unknown sample and the scaled training vector of class k , respectively. The scaled feature vectors are used mainly to remove large dynamic range on moments values. The scaled formula is as follows:

$$\tilde{v}_{s,j} = \frac{v_{s,j} - \min_k v_{t,j}^{(k)}}{\max_k v_{t,j}^{(k)} - \min_k v_{t,j}^{(k)}}. \quad (2.74)$$

The accuracy of a classifier is measured by

$$\eta = \frac{N_{\text{correct}}}{N_{\text{total}}} \quad (2.75)$$

where N_{correct} denotes the number of correctly classified images and N_{total} is the total number of images used in the testing set.

2.4.2 Discriminant Analysis

Discriminant analysis is a commonly used statistical technique for classification and to reduce the dimensionality of data (or known as feature selection process). The model is based on the assumption that the data is Gaussian mixture distributed (McLachlan & Wiley, 1992; Johnson & Wichern, 2002). Suppose for a p -dimensional feature data, conditional to be in class k , $\mathbf{X}|G=k \sim N_p(\mu_k, \Sigma_k)$. That is

$$f_k(x) = \frac{1}{(2\pi)^{p/2} |\Sigma_k|^{1/2}} \exp \left\{ -\frac{1}{2} (\mathbf{x} - \mu_k)^T \Sigma_k^{-1} (\mathbf{x} - \mu_k) \right\}. \quad (2.76)$$

In the case of linear discriminant analysis (LDA), the covariance matrices are assumed to be equal, i.e. $\Sigma_k = \Sigma$.

Suppose R is an N by K class membership matrix:

$$\begin{aligned} R_{n,k} &= 1 \quad \text{if observation } n \text{ is from class } k, \\ R_{n,k} &= 0 \quad \text{otherwise.} \end{aligned}$$

The parameters of the Gaussian distribution are estimated as follow:

(D1) The priori probability $P(G = k) = \hat{\pi}_k = \frac{N_k}{N}$, where N_k is the number of sample of class k .

(D2) The estimate of the class mean for data is

$$\hat{\mu}_k = \frac{\sum_{n=1}^N R_{n,k} x_n}{\sum_{n=1}^N R_{n,k}}. \quad (2.77)$$

(D3) The unbiased estimate of the pool-in covariance matrix is

$$\hat{\Sigma} = \frac{\sum_{n=1}^N \sum_{k=1}^K R_{n,k} (x_n - \hat{\mu}_k)(x_n - \hat{\mu}_k)^T}{N - K}. \quad (2.78)$$

The linear discriminant function $d_k^L(x)$ is estimated by

$$\hat{d}_k^L(x) = \hat{\mu}_k^T \hat{\Sigma}^{-1} x - \hat{\mu}_k^T \hat{\Sigma}^{-1} \hat{\mu}_k + \log(\hat{\pi}_k). \quad (2.79)$$

When the covariance matrices are not equal, we have the quadratic discriminant function $d_k^Q(x)$ estimated by

$$\hat{d}_k^Q(x) = \hat{\mu}_k^T \hat{\Sigma}_k^{-1} x - \hat{\mu}_k^T \hat{\Sigma}_k^{-1} \hat{\mu}_k + \log(\hat{\pi}_k). \quad (2.80)$$

The classification rule for both LDA and QDA is given as follows

$$\hat{D}(x) = k^* \Leftrightarrow k^* = \arg \max_k \hat{d}_k(x). \quad (2.81)$$

2.4.3 Support Vector Machine

Support Vector Machine (SVM) is a duo classes classifier introduced by Vapnik (1995). The basic idea of SVM is to map non-linear input vectors to a very high dimension

feature space where in this feature space a linear decision surface can be constructed with maximum between class separation (Vapnik, 1995; Cortes & Vapnik, 1995). The term SVM was originated from the points in the training set in which, are closet to the decision surface that called as support vectors. For a training set with instance-label pairs (\mathbf{x}_k, y_k) , $k = 1, 2, \dots, l$, where $\mathbf{x}_k \in \mathfrak{R}^n$ and $y \in \{1, -1\}^l$, the SVM requires the solution of the following optimization problem (Boser, Guyon, & V., 1992; Vapnik, 1995):

$$\begin{aligned} \min_{\mathbf{w}, b, \xi} \quad & \frac{1}{2} \mathbf{w}^T \mathbf{w} + C \sum_{k=1}^l \xi_k \\ \text{subject to} \quad & y_k (\mathbf{w}^T \phi(\mathbf{x}_k) + b) \geq 1 - \xi_k, \\ & \xi_k \geq 0. \end{aligned} \tag{2.82}$$

The vectors \mathbf{x}_k are mapped into higher (maybe infinite) dimensional space by the function ϕ . SVM will then find a linear separating hyperplane with maximum margin in this higher dimensional space. $C > 0$ is the penalty parameter of the error term. $K(\mathbf{x}_k, \mathbf{x}_j) = \phi(\mathbf{x}_k) \phi(\mathbf{x}_j)$ is called the kernel function. Below are the four commonly used basic kernels:

(E1) linear: $K(\mathbf{x}_k, \mathbf{x}_j) = \mathbf{x}_k^T \mathbf{x}_j$

(E2) polynomial: $K(\mathbf{x}_k, \mathbf{x}_j) = (\gamma \mathbf{x}_k^T \mathbf{x}_j + r)^d, \gamma > 0$

(E3) radial basis function (RBF): $K(\mathbf{x}_k, \mathbf{x}_j) = \exp(-\gamma \|\mathbf{x}_k - \mathbf{x}_j\|^2), \gamma > 0$

(E4) sigmoid: $K(\mathbf{x}_k, \mathbf{x}_j) = \tanh(\gamma \mathbf{x}_k^T \mathbf{x}_j + r)$

where γ, r and d are kernel parameters.

In this thesis, LIBSVM (Chang & Lin, 2011) will be deployed as SVM classification tools for the experiments.

2.4.4 Design of Experiments

One of the aim of this thesis is to derive new invariant algorithms for fast computation and new invariant features with better discriminative power and robustness to noise. Series of experiments are conducted to validate the finding. Large amount of binary patterns are used in the experiments. These include numbers, English letters, symbols, printed Chinese characters, Chinese handwritten characters (HCL2000 database),

objects, companies logo, etc. The selected images consist of symmetric objects and non-symmetric objects in different complexities. The binary images are being used as it is commonly used to validate the accuracy of moment invariant algorithms (Khotanzad & Yaw, 1990; Belkasim, 1991; Yap et al., 2003; Chong, Raveendran, & Mukundan, 2004; Zhu et al., 2007c; Goh et al., 2009; H. Zhang et al., 2010, 2011). As each pixel of binary pattern can only contain a single bit of information, the errors and loss of information cause by spatial transformation are therefore very severe when compared with gray scale images. Therefore in general moment invariants work better for gray scale images and excluded from the experiments.

The Euclidean distance classifier is used to evaluate the robustness of invariant descriptors to noise. The classifier is selected mainly due to its simplicity and popularity (Yap et al., 2003; Yap, 2006; Zhu et al., 2007c), and effectiveness especially for small training data set. The discriminant functions LDA and QDA are widely used in dimensional reduction of feature sets. It also commonly used in statistical data analysis. Support vector machine on the other hand is one of the most popular classifiers in the area of data mining to date. In view that different classifiers might exhibit different classification performance, to ensure objectivity, all three classifiers (LDA, QDA and SVM) are used in the experiment to determine the discriminant power of features.

CHAPTER 3

FAST COMPUTATION OF ANISOTROPIC SCALE AND TRANSLATION TCHEBICHEF MOMENT INVARIANTS USING ALGEBRAIC CANCELLATION APPROACH

In this chapter, anisotropic scale and translation invariants for Tchebichef moments by Zhu et al. (2007c) have been studied. Due to complexity of the hypergeometric function, the invariants algorithm is numerically inefficient. Two new faster computation algorithms have been proposed to improve the numerical performance of current method. The first proposed algorithm uses indirect method based on geometric moments. In the second algorithm, the descriptors are computed directly from the original Tchebichef moments using a new set of recurrence formula. Empirical studies that determine the accuracy of the features and the computation performance have been performed. The results show significant improvement in computational performance with the new proposed algorithms.

3.1 Introduction

Algebraic cancellation is an effective and accurate technique used on deriving the anisotropic scale and translation (AST) invariants for moment functions. The algorithm first eliminates the spatial displacement deformations using the central moments transformation, the scale parameters are then separated from the moments, and then eliminated via the algebraic cancellation process. Algebraic cancellation techniques were first introduced for geometric moments. Several cancellation schemes have been proposed, they can be divided into two groups: cancellation scheme for uniformly scaled deformation, and cancellation scheme for non-uniformly scaled deformation. For a uniformly scale deformed image, the scale invariants can be achieved with any of the following cancellation

schemes: (Belkasim, 1991; Prokop & Reeves, 1992)

$$I_{n,m}^{\langle \text{st-1} \rangle} = \frac{\mu_{n,m}}{(\mu_{0,0})^{\frac{(n+m+2)}{2}}} \quad (3.1)$$

$$I_{n,m}^{\langle \text{st-2} \rangle} = \frac{\mu_{n,m}}{(\mu_{2,0} + \mu_{0,2})^{\frac{(n+m+2)}{4}}} \quad (3.2)$$

$$I_{n,m}^{\langle \text{st-3} \rangle} = \frac{\mu_{n,m}}{\mu_{0,0}} \left(\frac{\mu_{0,0}}{\mu_{2,0} + \mu_{0,2}} \right)^{\frac{(n+m)}{2}} \quad (3.3)$$

where $\mu_{n,m}$ denotes the central moments.

Similarly, for a non-uniformly scale deformed image, scale invariants can be achieved with any of the following cancellation schemes:

$$I_{n,m}^{\langle \text{ast-PK} \rangle} = \frac{\mu_{n,m} \mu_{0,0}^{\frac{(n+m+2)}{2}}}{(\mu_{2,0})^{\frac{(n+1)}{2}} (\mu_{0,2})^{\frac{(m+1)}{2}}} \quad (3.4)$$

$$I_{n,m}^{\langle \text{ast-P} \rangle} = \frac{\mu_{n,m} \mu_{0,0}^{(\gamma+1)}}{\mu_{n+\gamma,0} \mu_{0,m+\gamma}}, \quad \gamma = 1, 2, \dots \quad (3.5)$$

where (3.4) denotes the cancellation scheme proposed by Pan and Keane (1994), and (3.5) is the cancellation scheme proposed by Palaniappan, Raveendran, and Omatu (2000) (denoted as AST-P).

The method (in particular the cancellation scheme by Palaniappan et al.(2000)) is then extended to derive AST invariants for Legendre moments by Chong et al. (2004) and AST invariants for discrete Tchebichef moments by Zhu et al. (2007c).

In Section 3.2, a brief overview on anisotropic scale and translation invariants for Tchebichef moments by Zhu et al. (2007c) (denoted as AST-Z) is given. This followed by a discussion of computational efficiency issues in Section 3.3. In Section 3.4, two new fast computation algorithms are proposed. The first algorithm indirectly compute AST-Z using the geometric moments. The second algorithm uses a new recursive function on Tchebichef moments. In Section 3.5 some empirical studies on the proposed algorithm are given.

3.2 Review on Anisotropic Scale and Translation Tchebichef moment invariants of Zhu et. al.

According to Zhu et al. (2007c), translation invariants, and non-uniform scale invariants were proposed as two separate algorithms. They were combined to form AST

invariants for Tchebichef moments later. Here $I_{n,m}^{(t-Z)}$ denotes the translated Tchebichef moment invariants by Zhu et al. (2007c) (T-Z), $I_{n,m}^{(as-Z)}$ is the corresponding invariant descriptors for anisotropic scale invariants (AS-Z), and the invariant descriptors for AST-Z is represented by $I_{n,m}^{(ast-Z)}$.

3.2.1 Translation Invariants of Tchebichef Moments

Consider Tchebichef polynomials $\{\tilde{t}_n^N(x)\}$ defined on $[0, N-1]$. $\tilde{t}_n^N(x)$ can be expressed as

$$\tilde{t}_n^N(x) = \sum_{k=0}^n \tilde{b}_{n,n-k} \langle x \rangle_k \quad (3.6)$$

where

$$\tilde{b}_{n,n-k} = \frac{1}{\sqrt{\rho(n,N)}} \frac{(n+k)! \langle n-N \rangle_{n-k}}{(n-k)!(k!)^2} \quad (3.7)$$

$\langle x \rangle_n$ denotes the falling factorial

$$\langle x \rangle_n = x \cdot (x-1) \cdots (x-n+1) \quad (3.8)$$

and $\rho(n,N)$ is the squared-norm given by

$$\rho(n,N) = \frac{N(N^2-1)(N^2-2^2) \cdots (N^2-n^2)}{2n+1}. \quad (3.9)$$

The translation invariant of Tchebichef moments, $I_{n,m}^{(t-Z)}$, are defined by the Tchebichef central moments $T_{n,m}^{(c)}$ as

$$\begin{aligned} I_{n,m}^{(t-Z)} &= T_{n,m}^{(c)} \\ &= \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(x-\bar{x}) \tilde{t}_m^N(y-\bar{y}) f(x,y), \\ &\quad n, m = 0, 1, \dots, N-1 \end{aligned} \quad (3.10)$$

where (\bar{x}, \bar{y}) denotes the centroid of the image.

As shown by Zhu et al. (2007c), spatial displacement coefficient is detachable from translated Tchebichef polynomial $\tilde{t}_n^N(x+a)$ such that

$$\tilde{t}_n^N(x+a) = \sum_{k=0}^n \tilde{v}_{n,n-k}(a) \tilde{t}_{n-k}^N(x). \quad (3.11)$$

Thus the Tchebichef central moments have the expression

$$\begin{aligned} T_{n,m}^{(c)} &= \sum_{k=0}^n \sum_{j=0}^m \tilde{v}_{n,n-k}(-\bar{x}) \tilde{v}_{m,m-j}(-\bar{y}) T_{n-k,m-j} \\ &\quad n, m = 0, 1, \dots, N-1 \end{aligned} \quad (3.12)$$

where

$$\begin{aligned} \tilde{v}_{n,n-k}(a)\tilde{b}_{n-k,n-k} &= \sum_{r=0}^k \binom{n-k+r}{r} \tilde{b}_{n,n-k+r} \langle a \rangle_r \\ &\quad - \sum_{u=0}^{k-1} \tilde{b}_{n-u,n-k} \tilde{v}_{n,n-u}(a) \end{aligned} \quad (3.13)$$

and $a = -\bar{x}$ or $-\bar{y}$.

Furthermore, the Tchebichef central moments can alternatively be expressed as

$$T_{n,m}^{(c)} = \sum_{k=0}^m \sum_{j=0}^n \sum_{r=0}^{k-1} \sum_{s=0}^{j-1} \tilde{f}_r(n,k) \tilde{f}_s(m,j) \langle -\bar{x} \rangle_{k-r} \langle -\bar{y} \rangle_{j-s} T_{n-k,m-j} \quad (3.14)$$

with

$$\begin{aligned} \tilde{f}_u(n,k) &= \frac{(n-k)!}{(2n-2k)!} \left\{ \frac{(2n-u)!}{u!(k-u)!(n-u)!} \frac{\beta(n-k,N)}{\beta(n,N)} \times \langle n-N \rangle_u \right. \\ &\quad - \frac{1}{(n-k)!} \sum_{p=0}^{u-1} \frac{(2n-2k-p+u)!}{(u-p)!} \frac{\beta(n-k,N)}{\beta(n-p-k+u,N)} \\ &\quad \left. \times \langle n-p-k+u-N \rangle_{u-p} \times \tilde{f}_p(n,k+p-u) \right\} \end{aligned} \quad (3.15)$$

and

$$\tilde{v}_{n,n-k}(a) = \sum_{u=0}^{k-1} \tilde{f}_u(n,k) \langle a \rangle_{k-u}. \quad (3.16)$$

3.2.2 Anisotropic Scale Invariant of Tchebichef Moments

Let the non-uniform scale transformed Tchebichef moments be defined as

$$\begin{aligned} T_{n,m}^{(as)} &= |ab| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(ax) \tilde{t}_m^N(by) f(x,y) \\ n,m &= 0, 1, \dots, N-1 \end{aligned} \quad (3.17)$$

where a and b denote the scale coefficients.

As shown by Comtet (1974),

$$\langle x \rangle_n = \sum_{k=0}^n s(n,k) x^k \quad (3.18)$$

with $s(n,k)$ denoting the Stirling numbers of the first kind having recurrence relations

$$s(n,k) = s(n-1,k-1) - (n-1)s(n-1,k) \quad (3.19)$$

and

$$\begin{aligned} s(0,0) &= 1 \\ s(n,0) &= s(0,k) = 0, \quad n \geq 1, k \geq 1. \end{aligned}$$

It can be easily deduced that

$$\tilde{t}_n^N(x) = \sum_{k=0}^n c_{n,k}^N x^k \quad (3.20)$$

where

$$c_{n,k}^N = \sum_{r=0}^{n-k} \tilde{b}_{n,n-r} s(n-r, k). \quad (3.21)$$

Similarly, the scaled Tchebichef polynomial, $\tilde{t}_n^N(ax)$, can be expressed as n -order polynomial of ax :

$$\tilde{t}_n^N(ax) = \sum_{k=0}^n c_{n,k}^N a^k x^k. \quad (3.22)$$

From (3.22), an expression that separates the scale coefficients from the original Tchebichef polynomials can be derived such that

$$\sum_{k=0}^n \kappa_{n,k} \tilde{t}_k(ax) = a^n \sum_{k=0}^n \kappa_{n,k} \tilde{t}_k(x) \quad (3.23)$$

where

$$\kappa_{n,k} = \begin{cases} 1, & k = n \\ \sum_{u=0}^{n-k-1} \frac{-c_{n-u,k}^N \kappa_{n,n-u}}{c_{k,k}^N}, & 0 \leq k < n. \end{cases} \quad (3.24)$$

Consider

$$c_{n,k}^N = \sum_{r=0}^{n-k} c_{n,k}^N(r) \quad (3.25)$$

in which,

$$c_{n,k}^N(r) = \tilde{b}_{n,n-r} s(n-r, k). \quad (3.26)$$

The following recurrence relation has been derived to improve the computation efficiency

$$c_{n,k}^N(r-1) = \frac{r(2n-r+1)}{(n-N-r+1)(n-r+1)^2} \times \frac{s(n-r+1, k)}{s(n-r, k)} \times c_{n,k}^N(r) \\ k \leq n-r, \quad 0 \leq r \leq n-1. \quad (3.27)$$

with

$$c_{n,0}^N(n) = \tilde{b}_{n,0}. \quad (3.28)$$

As shown by (3.23) and (3.24), the scale coefficients can be separated from the original Tchebichef polynomials. Let

$$\varphi_{n,m} = \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} T_{n,m}. \quad (3.29)$$

The relation between the original and scaled Tchebichef moments are

$$\begin{aligned}
\phi'_{n,m} &= |ab| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} \tilde{t}_k^N(ax) \tilde{t}_j^N(by) f(x,y) \\
&= a^{n+1} b^{m+1} \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_k^N(x) \tilde{t}_j^N(y) f(x,y) \\
&= a^{n+1} b^{m+1} \phi_{n,m}.
\end{aligned} \tag{3.30}$$

By using the cancellation scheme proposed by Palaniappan et al. (2000), the scale factors a and b can then be eliminated. Thus the invariant descriptors of AS-Z can be written as

$$\begin{aligned}
I_{n,m}^{(as-Z)} &= \frac{\phi_{n,m} \phi_{0,0}^{\gamma+1}}{\phi_{n+\gamma,0} \phi_{0,m+\gamma}}, \\
n, m &= 0, 1, \dots, N-1-\gamma, \quad \text{and} \quad \gamma = 1, 2, \dots.
\end{aligned} \tag{3.31}$$

3.2.3 Anisotropic Scale and Translation Invariants of Tchebichef Moments

Let $T_{n,m}^{(ast)}$ denote the AST transformed Tchebichef moments which are given by

$$\begin{aligned}
T_{n,m}^{(ast)} &= |a_1 b_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(a_1 x + a_2) \tilde{t}_m^N(b_1 y + b_2) f(x,y), \\
n, m &= 0, 1, \dots, N-1
\end{aligned} \tag{3.32}$$

where a_1 and b_1 denote the scale coefficients, and a_2 and b_2 are the spatial displacement coefficients.

The coefficients a_2 and b_2 can be eliminated by using the Tchebichef central moments, (3.32) becomes

$$T_{n,m}^{(c,ast)} = |a_1 b_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(a_1(x - \bar{x})) \tilde{t}_m^N(b_1(y - \bar{y})) f(x,y). \tag{3.33}$$

Suppose

$$\phi_{n,m} = \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} T_{k,j}^{(c)} \tag{3.34}$$

where $\kappa_{n,k}$ denotes the coefficient of Tchebichef moments defined by (3.24).

The coefficient a_1 and b_1 can then be separated from the original central Tchebichef moments as

$$\begin{aligned}
\phi'_{n,m} &= |a_1 b_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} \tilde{t}_k^N(a_1(x - \bar{x})) \tilde{t}_j^N(b_1(y - \bar{y})) f(x,y) \\
&= a_1^{n+1} b_1^{m+1} \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_k^N(x - \bar{x}) \tilde{t}_j^N(y - \bar{y}) f(x,y) \\
&= a_1^{n+1} b_1^{m+1} \phi_{n,m}.
\end{aligned} \tag{3.35}$$

With the similar cancellation process used in (3.31), the invariant descriptors of AST-Z are

$$I_{n,m}^{(\text{ast-Z})} = \frac{\phi_{n,m}\phi_{0,0}^{\gamma+1}}{\phi_{n+\gamma,0}\phi_{0,m+\gamma}}, \quad n, m = 0, 1, \dots, N-1-\gamma, \quad \text{and} \quad \gamma = 1, 2, \dots. \quad (3.36)$$

3.3 Numerical Computations on Anisotropic Scale and Translation Invariants of Zhu et. al.

In this subsection we discuss the implementation of invariant algorithms of Zhu et al. (2007c).

3.3.1 Numerical Computations on Translation Invariants

The translation invariants T-Z can be computed by using (3.12) or (3.14). In the first approach, $v_{n,n-k}(\bar{x})$ is computed using (3.13), a recurrence relation on $\tilde{b}_{n,n-k}$ can be derived as

$$\tilde{b}_{n,n-k} = \frac{(k+1)^2(k+1-N)}{(n-k)(n+k+1)}\tilde{b}_{n,n-1-k}, \quad k = n-1, n-2, \dots, 0 \quad (3.37)$$

and

$$\begin{aligned} \tilde{b}_{n,0} &= \tilde{b}_{n-1,0} \frac{2}{n} \sqrt{\frac{(4n^2-1)}{(N^2-n^2)}}, \quad n = 1, 2, \dots, N-1, \\ \tilde{b}_{0,0} &= \frac{1}{\sqrt{N}}. \end{aligned}$$

In the latter approach, the recurrence relation $v_{n,n-k}(\bar{x})$ is computed using (3.16) and (3.15). However the expression of $f_u(n, k)$ is complicated. To simplify this, the function is decomposed into several sub-functions where each of them is expressible recursively. We have

$$\tilde{f}_u(n, k) = D(n, k, u, N) + \sum_{p=0}^{u-1} E(n, k, u, p, N) \tilde{f}_p(n, k+p-u) \quad (3.38)$$

where

$$\tilde{f}_0(n, k) = D(n, k, 0, N) \quad (3.39)$$

and

$$\begin{aligned}
D(n, k, u, N) &= \frac{(n-k)!}{(2n-2k)!} \frac{(2n-u)!}{u!(k-u)!(n-u)!} \frac{\beta(n-k, N)}{\beta(n, N)} \times \langle n-N \rangle_u \quad (3.40) \\
E(n, k, u, p, N) &= -\frac{(2n-2k-p+u)!}{(2n-2k)!(u-p)!} \frac{\beta(n-k, N)}{\beta(n-p-k+u, N)} \\
&\quad \times \langle n-p-k+u-N \rangle_{u-p} \quad (3.41)
\end{aligned}$$

with

$$\beta(n, N) = \sqrt{\rho(n, N)}.$$

The recurrence relations of $D(n, k, u, N)$ and $E(n, k, i, m, N)$ can be derived as

$$\begin{aligned}
D(n, k, u, N) &= D(n, k, u-1, N) \frac{(k-u+1)(n-u+1)(n-N-u+1)}{u(2n-u+1)} \\
D(n, k, 0, N) &= D(n, k-1, 0, N) \frac{2}{k} \sqrt{\frac{(2n-2k+3)(2n-2k+1)}{(N^2 - (n-k+1)^2)}}
\end{aligned}$$

and

$$\begin{aligned}
E(n, k, u, p, N) &= E(n, k, u, p-1, N) \times \frac{(u-p+1)}{(2n-2k-p+u+1)(n-k-N+1+u-p)} \\
&\quad \times \sqrt{\frac{[2(n-p-k+u)+1][N^2 - (n-p-k+u+1)^2]}{[2(n-p-k+u)+3]}} \\
E(n, k, u, p, N) &= E(n, k, u-1, p, N) \times \frac{(2n-2k-p+u)(n-k-N+u-p)}{(u-p)} \\
&\quad \times \sqrt{\frac{[2(n-p-k+u-1)+1]}{[2(n-p-k+u)+1][N^2 - (n-p-k+u)^2]}}.
\end{aligned}$$

3.3.2 Numerical Computations of Translation and Scale Invariants

As shown in (3.36), to get AST-Z, we first need to obtain Tchebichef central moments using (3.12) or (3.14). It is then followed by computation of expression $\phi_{n,m}$ using (3.34), and finally, the invariant descriptors are obtained by the cancellation process using (3.36). The complexity of the algorithms and the sequential computation on Tchebichef central moments followed by scale invariants appeared to be the bottleneck for AST-Z which will be resolved by new proposed algorithms.

3.4 Fast Computation for Translation and Scale Invariants

In this section two sets of fast computation algorithms are proposed. The first set of fast computation algorithms compute T-Z, AS-Z and AST-Z indirectly using geometric

moments. The latter approach computes the invariants from Tchebichef moments using the new set of recurrence relations.

3.4.1 Fast Computation on Translation Invariants using Indirect Approach

From (3.20), Tchebichef central moments can be deduced from geometric central moments $\mu_{k,j}$ to give

$$\begin{aligned} T_{n,m}^{(c)} &= \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(x - \bar{x}) \tilde{t}_m^N(y - \bar{y}) f(x, y) \\ &= \sum_{k=0}^n \sum_{j=0}^m c_{n,k}^N c_{m,j}^N \mu_{k,j}. \end{aligned} \quad (3.42)$$

Similar to the AS-Z invariants, for this method to be efficient, pre-computation on coefficients $c_{n,k}^N$ using (3.25) to (3.28) is required.

3.4.2 Fast Computation on Anisotropic Scale and Translation Invariants Using Indirect Approach

The indirect expression of AST-Z using geometric moments can be simplified with the following theorem.

Theorem 3.4.1. *Suppose that*

$$\xi_n(ax) = \sum_{k=0}^n \alpha_{n,k} \tilde{t}_k(ax) \quad (3.43)$$

where the coefficients $\alpha_{n,k}$ are constants, and $\alpha_{n,n} \neq 0$, then

$$\xi_n(ax) = a^n \xi_n(x) \quad (3.44)$$

if and only if

$$\xi_n(ax) = a^n \alpha_{n,n} c_{n,n}^N x^n. \quad (3.45)$$

Proof. It is obvious that $\xi_n(ax) = a^n \xi_n(x)$ if $\xi_n(ax) = a^n \alpha_{n,n} c_{n,n}^N x^n$.

As $\alpha_{n,n} \neq 0$, $\xi_n(ax)$ is an n^{th} -degree polynomial of x that is

$$\xi_n(ax) = \sum_{k=0}^n D_{n,k} a^k x^k \quad (3.46)$$

where $D_{n,k}$ is the constant coefficient for $(ax)^k$.

From (3.44), we have

$$\sum_{k=0}^n D_{n,k} x^k = \sum_{k=0}^n D_{n,k} a^{(k-n)} x^k. \quad (3.47)$$

By comparing the coefficient of x^k , we get

$$D_{n,k} = D_{n,k} a^{(k-n)} \quad (3.48)$$

As a can be any non-zero real constant, (3.48) will only be true if $D_{n,k} = 0$ when $k < n$.

This proved the theorem. \square

From Theorem 3.4.1, and the values $\kappa_{n,n} = 1$, the expression $\phi_{n,m}$ of (3.23) can be simplified as

$$\sum_{k=0}^n \kappa_{n,k} \tilde{t}_k^N(ax) = a^n c_{n,n}^N x^n. \quad (3.49)$$

Therefore $\phi_{n,m}$ of (3.34) can be written as

$$\phi_{n,m} = \sum_{k=0}^n \sum_{j=0}^m \kappa_{n,k} \kappa_{m,j} T_{k,j} = c_{n,n}^N c_{m,m}^N \mu_{n,m} \quad (3.50)$$

and the invariant descriptor of AST-Z has expression

$$I_{n,m}^{\langle \text{ast-Z} \rangle} = \frac{c_{n,n}^N c_{m,m}^N (c_{0,0}^N)^{2\gamma} \mu_{n,m} (\mu_{0,0})^{\gamma+1}}{c_{n+\gamma,n+\gamma}^N c_{m+\gamma,m+\gamma}^N \mu_{n+\gamma,0} \mu_{0,m+\gamma}} \quad \gamma = 1, 2, \dots \quad (3.51)$$

where $\mu_{n,m}$ denotes the geometric central moments.

The anisotropic scale invariants, AS-Z, on the other hand, can be derived using the same procedure with exception that the central moments $\mu_{p,q}$ of (3.50) is replaced by the geometric moments $m_{p,q}$.

The invariant descriptors (3.51), also show a strong correlation between AST-Z of Tchebichef moments and AST-P of Geometric moments which is given by

$$I_{n,m}^{\langle \text{ast-Z} \rangle} = \frac{c_{n,n}^N c_{m,m}^N (c_{0,0}^N)^{2\gamma}}{c_{n+\gamma,n+\gamma}^N c_{m+\gamma,m+\gamma}^N} I_{n,m}^{\langle \text{ast-P} \rangle} \quad n, m = 0, 1, \dots, N-1-\gamma, \quad \text{and} \quad \gamma = 1, 2, \dots \quad (3.52)$$

In the event when an image is not available, for example in image compression, only the selected orders of the Tchebichef moments are recorded, the indirect approach is not applicable. Therefore we propose an alternative approach that derives the invariants directly from the Tchebichef moments.

3.4.3 Fast Computation using New Recurrence Relation

In the process of generating the Tchebichef moments, the basis functions are not computed directly using its original definition. This is due to the complexity of the hypergeometric functions. In such case, the three terms recurrence relation is used extensively to speed-up the numerical computations. Following the same idea, the three terms recurrence relation will be deployed to simplify the expressions of invariant algorithms. The three terms recurrence relation of Tchebichef polynomial $\tilde{t}_n^N(x)$ is given by

$$\begin{aligned}\tilde{t}_n^N(x) &= (x\tilde{A}_n^N + \tilde{B}_n^N)\tilde{t}_{n-1}^N(x) + \tilde{C}_n^N\tilde{t}_{n-2}^N(x), \\ n &= 2, 3, \dots, N-1\end{aligned}\quad (3.53)$$

and

$$\tilde{t}_0^N(x) = \frac{1}{\sqrt{N}} \quad (3.54)$$

$$\tilde{t}_1^N(x) = (x\tilde{A}_1^N + \tilde{B}_1^N)\tilde{t}_0^N(x) \quad (3.55)$$

where

$$\tilde{A}_n^N = \frac{2}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (3.56)$$

$$\tilde{B}_n^N = \frac{(1-N)}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (3.57)$$

$$\tilde{C}_n^N = -\frac{(n-1)}{n} \sqrt{\frac{2n+1}{2n-3}} \sqrt{\frac{N^2 - (n-1)^2}{N^2 - n^2}}. \quad (3.58)$$

3.4.4 Fast Computation of Translation Invariants using Recurrence Relations Approach

The recurrence relation of Tchebichef central moments in (3.12) is given by the following theorem.

Theorem 3.4.2.

$$\begin{aligned}\tilde{t}_n^N(x+a) &= \sum_{k=0}^n v_{n,k}(a)\tilde{t}_k^N(x) \\ n &= 0, 1, \dots, N-1\end{aligned}\quad (3.59)$$

if

$$v_{n,k}(a) = \begin{cases} 1, & \text{if } n = k \\ v_{n-1,k-1}(a)K_{n,k}^{N,N} - v_{n-1,k}(a)\tilde{A}_n^N + v_{n-2,k}(a)\tilde{C}_n^N \\ - v_{n-1,k+1}(a)K_{n,k+2}^{N,N}\tilde{C}_{k+2}^N, & \text{if } n > k \end{cases} \quad (3.60)$$

and

$$K_{n,k}^{N,N} = \frac{\tilde{A}_n^N}{\tilde{A}_k^N}. \quad (3.61)$$

Proof. From (3.54) and (3.55), it is easily shown that

$$\tilde{t}_0^N(x+a) = \tilde{t}_0^N(x) \quad (3.62)$$

$$\tilde{t}_1^N(x+a) = \tilde{t}_1^N(x) + a\tilde{A}_1^N\tilde{t}_0^N(x) \quad (3.63)$$

where

$$v_{0,0}(a) = 1 \quad (3.64)$$

$$v_{1,1}(a) = 1 \quad \text{and} \quad v_{1,0}(a) = a\tilde{A}_1^N. \quad (3.65)$$

By induction, suppose

$$\tilde{t}_p^N(x+a) = \sum_{k=0}^p v_{p,k}(a)\tilde{t}_k^N(x) \quad (3.66)$$

for $p \leq n$, we now consider $\tilde{t}_{n+1}^N(x+a)$.

From (3.53) the translated Tchebichef polynomial $\tilde{t}_{n+1}^N(x+a)$ has expression

$$\tilde{t}_{n+1}^N(x+a) = [(x+a)\tilde{A}_{n+1}^N + \tilde{B}_{n+1}^N]\tilde{t}_n^N(x+a) + \tilde{C}_{n+1}^N\tilde{t}_{n-1}^N(x+a). \quad (3.67)$$

By substituting with (3.66), we get

$$\begin{aligned} \tilde{t}_{n+1}^N(x+a) &= x\tilde{A}_{n+1}^N \sum_{k=0}^n v_{n,k}(a)\tilde{t}_k^N(x) + [a\tilde{A}_{n+1}^N + \tilde{B}_{n+1}^N] \sum_{k=0}^n v_{n,k}(a)\tilde{t}_k^N(x) + \\ &\quad \tilde{C}_{n+1}^N \sum_{k=0}^{n-1} v_{n-1,k}(a)\tilde{t}_k^N(x). \end{aligned} \quad (3.68)$$

Consider the expression with x of (3.68), the variable x can be eliminated by reapplying the three terms recurrence relation as such

$$\begin{aligned} x\tilde{A}_{n+1}^N \sum_{k=0}^n v_{n,k}(a)\tilde{t}_k^N(x) &= \sum_{k=0}^n v_{n,k}(a)K_{n+1,k+1}^{N,N}[\tilde{t}_{k+1}^N(x) \\ &\quad - \tilde{B}_{k+1}^N\tilde{t}_k^N(x) - \tilde{C}_{k+1}^N\tilde{t}_{k-1}^N(x)]. \end{aligned} \quad (3.69)$$

By substituting (3.69) back into (3.68), and some simplification steps, we thus have

$$\begin{aligned} \tilde{t}_{n+1}^N(x+a) = & \sum_{k=0}^{n+1} \left\{ v_{n,k-1}(a) K_{n+1,k}^{N,N} - a \tilde{A}_{n+1}^N v_{n,k}(a) \right. \\ & \left. + \tilde{C}_{n+1}^N v_{n-1,k}(a) - v_{n,k+1}(a) K_{n+1,k+2}^{N,N} \tilde{C}_{k+2}^N \right\} \tilde{t}_k^N(x). \end{aligned} \quad (3.70)$$

This proved the theorem. \square

From Theorem 3.4.2, the Tchebichef central moments $T_{n,m}^{(c)}$ can thus be effectively calculated by (3.12) and (3.60).

3.4.5 Fast Computation of Anisotropic Scale and Translation Invariants using Recurrence Relations Approach

In this subsection, recurrence relation of AST-Z and AS-Z is derived using the following theorem.

Theorem 3.4.3. *Suppose that*

$$\xi_n(x) = \sum_{k=0}^n \alpha_{n,k}(\bar{x}) \tilde{t}_k^N(x) \quad (3.71)$$

where $\alpha_{n,k}(\bar{x})$ are functions with image centroid \bar{x} as parameter and $\alpha_{n,n}(\bar{x}) \neq 0$. Then

$$\begin{aligned} \xi_n(a_1x + a_2) &= a_1^n \xi_n(x), \\ n &= 0, 1, \dots, N-1 \end{aligned} \quad (3.72)$$

if

$$\alpha_{n,k}(\bar{x}) = \begin{cases} 1, & \text{if } n = k \\ \alpha_{n-1,k-1}(\bar{x}) K_{n,k}^{N,N} - \alpha_{n-1,k}(\bar{x}) \left[\bar{x} - \frac{(N-1)}{2} \right] \tilde{A}_n^N \\ \quad - \alpha_{n-1,k+1}(\bar{x}) K_{n,k+2}^{N,N} \tilde{C}_{k+2}^N, & \text{if } n > k \end{cases} \quad (3.73)$$

and

$$K_{n,k}^{N,N} = \frac{\tilde{A}_n^N}{\tilde{A}_k^N}. \quad (3.74)$$

Proof. Suppose

$$x' = a_1x + a_2, \quad (3.75)$$

we found

$$x' - \bar{x}' = a_1(x - \bar{x}). \quad (3.76)$$

Suppose

$$\xi_0(x') = \tilde{t}_0^N(x') \quad (3.77)$$

From (3.54) we can easily deduce that

$$\xi_0(x') = \tilde{t}_0^N(x') = \frac{1}{\sqrt{N}} = \tilde{t}_0^N(x) = a_1^0 \xi_0(x) \quad (3.78)$$

which means

$$\alpha_{0,0}(\bar{x}') = \alpha_{0,0}(\bar{x}) = 1. \quad (3.79)$$

By multiplying (3.78), with $(x' - \bar{x}') \tilde{A}_1^N$, and simplify the right hand side with (3.76), we get

$$(x' - \bar{x}') \tilde{A}_1^N \xi_0(\bar{x}') = a(x - \bar{x}) \tilde{A}_1^N \xi_0(x). \quad (3.80)$$

Consider the left hand side of (3.80), the variable x' can be eliminated using the three terms recurrence relation in (3.53). We get

$$\begin{aligned} (x' - \bar{x}') \tilde{A}_1^N \xi_0(x') &= (x' - \bar{x}') \tilde{A}_1^N \alpha_{0,0}(\bar{x}') \tilde{t}_0^N(x') \\ &= \alpha_{0,0}(\bar{x}') \left[(x' \tilde{A}_1^N + \tilde{B}_1^N) \tilde{t}_0^N(x') - (\bar{x}' \tilde{A}_1^N + \tilde{B}_1^N) \tilde{t}_0^N(x') \right] \\ &= \tilde{t}_1^N(x') - \left(\bar{x}' - \frac{(N-1)}{2} \right) \tilde{A}_1^N \tilde{t}_0^N(x') \\ &= \xi_1(x'). \end{aligned} \quad (3.81)$$

From this we obtain,

$$\alpha_{1,1}(\bar{x}') = 1, \quad \text{and} \quad \alpha_{1,0}(\bar{x}') = - \left(\bar{x}' - \frac{(N-1)}{2} \right) \tilde{A}_1^N. \quad (3.82)$$

When the similar procedure is applied to right hand side of (3.80), we have

$$\begin{aligned} a(x - \bar{x}) \tilde{A}_1^N \xi_0(x) &= a \left[\tilde{t}_1^N(x) - (\bar{x} \tilde{A}_1^N + \tilde{B}_1^N) \tilde{t}_0^N(x) \right] \\ &= a \xi_1(x) \end{aligned} \quad (3.83)$$

and

$$\alpha_{1,1}(\bar{x}) = 1 \quad \text{and} \quad \alpha_{1,0}(\bar{x}) = - \left(\bar{x} - \frac{(N-1)}{2} \right) \tilde{A}_1^N. \quad (3.84)$$

Suppose that $\xi_k(\bar{x}') = a^k \xi_k(x)$ for $k \leq n$, we now consider $\xi_{n+1}(\bar{x}')$.

Assuming

$$\xi_{n+1}(\bar{x}') = (x' - \bar{x}') \tilde{A}_{n+1}^N \xi_n(\bar{x}'). \quad (3.85)$$

From the induction hypothesis, we have

$$(x' - \bar{x}') \tilde{A}_{n+1}^N \xi_n(\bar{x}') = a^{n+1} (x - \bar{x}) \tilde{A}_{n+1}^N \xi_n(\bar{x}). \quad (3.86)$$

Consider the left hand side of (3.86), we have

$$\begin{aligned} (x' - \bar{x}') \tilde{A}_{n+1}^N \xi_n(\bar{x}') &= \sum_{k=0}^n \alpha_{n,k}(\bar{x}') K_{n+1,k+1}^{N,N} x' \tilde{A}_{k+1}^N \tilde{t}_k(x') \\ &\quad - \sum_{k=0}^n \alpha_{n,k}(\bar{x}') \bar{x}' \tilde{A}_{n+1}^N \tilde{t}_k(x'). \end{aligned} \quad (3.87)$$

The variable x' can be eliminated by using (3.53). Therefore we get

$$\begin{aligned} \xi_{n+1}(\bar{x}') &= \sum_{k=0}^{n+1} \left[\alpha_{n,k-1}(\bar{x}') K_{n+1,k}^{N,N} - \alpha_{n,k}(\bar{x}') K_{n+1,k+1}^{N,N} B_{k+1}^N \right. \\ &\quad \left. - \alpha_{n,k+1}(\bar{x}') K_{n+1,k+2}^{N,N} \tilde{C}_{k+2}^N - \alpha_{n,k}(\bar{x}') \bar{x}' \tilde{A}_{n+1}^N \right] \tilde{t}_k(x'). \end{aligned} \quad (3.88)$$

Similarly for the right hand side of (3.86),

$$\begin{aligned} a^{n+1} (x - \bar{x}) \tilde{A}_{n+1}^N \xi_n(\bar{x}) &= a^{n+1} \sum_{k=0}^{n+1} \left[\alpha_{n,k-1}(\bar{x}) K_{n+1,k}^{N,N} - \alpha_{n,k}(\bar{x}) K_{n+1,k+1}^{N,N} B_{k+1}^N \right. \\ &\quad \left. - \alpha_{n,k+1}(\bar{x}) K_{n+1,k+2}^{N,N} \tilde{C}_{k+2}^N - \alpha_{n,k}(\bar{x}) \bar{x} \tilde{A}_{n+1}^N \right] \tilde{t}_k(x) \end{aligned} \quad (3.89)$$

and this proved the recurrence relation (3.73). \square

Suppose

$$\begin{aligned} \phi_{n,m} &= \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \xi_n(x) \xi_m(y) f(x, y), \\ &= \sum_{k=0}^n \sum_{j=0}^m \alpha_{n,k}(\bar{x}) \alpha_{m,j}(\bar{y}) T_{n,m}. \end{aligned} \quad (3.90)$$

The transformed moments and the original moments can be established as

$$\begin{aligned} \phi'_{n,m} &= |a_1 b_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \xi_n(a_1 x + a_2) \xi_m(b_1 y + b_2) f(x, y), \\ &= a_1^{n+1} b_1^{m+1} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \xi_n(x) \xi_m(y) f(x, y), \\ &= a_1^{n+1} b_1^{m+1} \phi_{n,m} \end{aligned} \quad (3.91)$$

By the cancellation process using (3.36), we thus get AST-Z. On the other hand, when

$\bar{x} = \bar{y} = 0$ in (3.90), the features computed by (3.36) are AS-Z.

3.4.6 Invariants with Skew Parameters

As shown in (3.51), AST-Z works well for non-symmetric images. However for symmetric images, large portion of odd order AST-Z descriptors will have zero values which may cause difficulty in classification. To overcome this problem, additional skew parameters (denoted as w_x and w_y) are added to $v_{n,n-k}$ and $v_{m,m-j}$ of (3.12). In our implementation, we let

$$w_x = \text{sign}(\mu_{3,0})\overline{\omega}_x\sqrt{\frac{\mu_{2,0}}{\mu_{0,0}}}, \quad \text{and} \quad w_y = \text{sign}(\mu_{0,3})\overline{\omega}_y\sqrt{\frac{\mu_{0,2}}{\mu_{0,0}}}. \quad (3.92)$$

where $\mu_{k,j}$ denotes the central moment, $\overline{\omega}_x$ and $\overline{\omega}_y$ are skew factors in direction of x -axis and y -axis, respectively. The skew parameters w_x and w_y are designed such that (3.51) preserves the AST-invariance and gives non-zero values for all the odd-orders of AST-Z descriptors of symmetrical and non-symmetrical images.

3.5 Experimental Results

Several experiments were carried out to validate the accuracy and numerical performance of the proposed method on AST-Z. Binary patterns that consist of English letters, symbols, numbers and Chinese letters, varying from simple to complex patterns, with and without symmetries are used. Similar to Zhu et al. (2007c), and Chong et al. (2004), the accuracy of features are measured by relative standard deviation (RSD) with percentage spread i.e.

$$\text{RSD}(\%) = \frac{\sigma}{|\mu|}\% \quad (3.93)$$

where σ and μ denote the standard deviation and mean of the Tchebichef features, respectively.

3.5.1 Experiment on Accuracy of Invariant Descriptors

In this section we evaluate the accuracy of invariant descriptors T-Z, AS-Z and AST-Z using the proposed algorithms. Sets of patterns in different size, complexity, symmetric and non-symmetric, in different degree of deformations are used to evaluate the accuracy of new proposed algorithms. When large set of images exhibit similar performance, for simplicity, only selected images are shown to reflect the overall performance of the features. In addition, the proposed algorithms are just a new way to compute the invariants

descriptors by Zhu et al. (2007c). The result is therefore completely identical to original formulation. Thus only one set of result is shown in each experiment.

First of all, we evaluate the translation invariants (T-Z). As the accuracy performance on various images are identical, only the results of the following two patterns are shown: a Chinese character “和” and an English “A”. The Chinese letter represents group of non-symmetric images and the latter represents group of symmetric images, The Chinese character “和” is with size of 40×40 pixels, is shifted up and down, left and right arbitrary, as well as diagonally in relative to center of image space $S_2(50)$ by a single pixel value (note that $S_2(N) = \{(x, y) \mid x, y = 0, 1, \dots, N-1\}$). As shown in Table 3.1, Tchebichef central moments remain unchanged for all the translations and RSD is zero. On the other hand, the symmetric letter “A” of size 40×40 pixels is transformed under different translation factors relative to center of image space $S_2(80)$. As shown in Table 3.2, unlike the geometric central moments, Tchebichef central moments are non-zero for most of the odd order moments. This can be explained by the fact that Tchebichef polynomials are not symmetric at the centroid of image but at the middle of image space instead. By having image’s centroid transformed to its origin, will move the image away from the middle of image space and the odd order translation descriptors will therefore be non-zero.

In testing the accuracy of AS-Z, the results shown in Table 3.3. In this experiment, translation descriptors are not involved. The scale factors are randomly selected between 0.6 to 2.6. As AS-Z and AST-Z are similar to AST-P, where the odd degree of central moments are usually small. Therefore the coefficient γ is set to 2 to ensure the numerical stability in cancellation process of (3.36). It is shown that, the values of invariants descriptors almost remain unchanged under different non-uniform scale transformation.

In the third experiment, the accuracy of AST-Z are evaluated using the patterns from the four distinct groups of characters i.e. numbers, alphabets, symbols and Chinese characters. For simplicity, one image is selected from each group to represent the overall performance on AST-Z. The patterns are 80×80 pixels in image space $S_2(250)$. As shown in Table 3.4, each character is non-uniformly expanded, contracted or reflected and then translated from the middle of domain. The results are shown in Table 3.5 and Table 3.6. In Table 3.5, the skew coefficient w_x and w_y are set to zero. There are large fluctuation

in accuracy of invariant features especially on the odd-order moments. This can be explained by the fact that the moments $\phi_{n,m}$ of (3.90) are equivalent to central moment of geometric moments. It is well known that the odd order central moments are usually small even for non-symmetric images. As a result, they are vulnerable to discretization errors. To overcome this problem, the skew parameters are introduced to shift the centroid away from the origin to avoid the errors caused by cancellation between small moment values. As shown in Table 3.6, the accuracy improved significantly when the skew parameters ϖ_x and ϖ_y are set to 13 and 10, respectively. Generally, the accuracy of AST-Z can be improved with other skew parameter values. The skew parameters above are selected so that the values of moment invariants are smaller than unity. However note that by shifting too much away from centroid, it will also reduce the within class separation. Thus compromise the discriminative power of the features in classification.

3.5.2 Experiment on Numerical Efficiency

The computational efficiency on AST-Z and T-Z are shown in Table 3.7 and Table 3.8, respectively. Here AST-Z(1) and T-Z(1) denote the invariant descriptors with (3.12) to compute the translation invariants. AST-Z(2) and T-Z(2) denote the invariants descriptors with (3.14) for the translation invariants. AST-Z(R) and T-Z(R) denote the invariants descriptors computed by the proposed method using the new proposed recurrence relations. As the algorithms above are based on Tchebichef moments, extra time is required to generate the Tchebichef moments (see column 4). AST-Z(ID) and T-Z(ID) on the other hand denote the invariants of AST-Z and T-Z computed using the indirect approach, respectively. In this method the invariants are computed from geometric central moments. The generation time of Tchebichef moments is thus not required. The application was developed by using Matlab 2011b on a PC with Intel i3 550, 3GB of RAM and 3.2GHz processor. In this experiment, images with size 50×50 , 100×100 , 150×150 , and 200×200 were used to generate invariant features with orders of 10, 20, 30 and 40. The experiment was repeated 200 times and the average CPU elapse times in units of millisecond were recorded.

With AST-Z(R), the invariants generation time of AST-Z improved by 37.8 and 38.2 times when compared with AST-Z(1) and AST-Z(2), respectively (see the average performance on column 5, 7 and 9 of Table 3.7). The significant improvement can be explained by the simplicity of the new proposed recurrence relations, and the complexity of algorithms, and the sequential computation of invariant descriptors by Zhu et al. (2007c). The algorithm AST-Z(R) also slightly faster than AST-Z(ID) (see column 3 and 6) despite the simplicity of the indirect expression. The performance of AST-Z(1) and AST-Z(2) are nearly identical. This indicate the complexity of the two approach are nearly identical.

The invariant generation times of AST-Z(R), AST-Z(1), and AST-Z(2), increase proportionally to the order of moment invariants and are less sensitive to the size of images. On the other hand moment generation times increase proportionally to both image size and the order of moments. This can be easily explained by the definition of discrete Tchebichef moments and the construction of the invariant functions.

Computation efficiency on translation invariant descriptors are showed in Table 3.8. As shown in the table, the proposed methods exhibit similar trends on preceding table

when they are compared with original algorithms by Zhu et al. (2007c).

3.6 Conclusion

In this chapter, two fast computation algorithms for the anisotropic scale and translation Tchebichef moment invariants of Zhu et al. (2007c) have been derived. The first algorithm indirectly computes the invariant descriptors using geometric moments. The second algorithm derives the invariants from Tchebichef moments using new set of recurrence relations. As the proposed recurrence relations are simplified using the properties of orthogonal moments, it is much simpler and able to outperform existing algorithms by large margin.

CHAPTER 4

ANISOTROPIC SCALE AND TRANSLATION TCHEBICHEF MOMENT INVARIANTS USING IMAGE NORMALIZATION TECHNIQUE

Image normalization is an effective technique in deriving invariants for classification systems. In this chapter, AST invariants based on moment normalization is studied. A new set of recurrence relations is proposed for fast computation of AST invariants by this approach. To enhance the features discriminative power, the Tchebichef polynomials' centre of symmetry is selected as centroid of canonical images. In addition, three new scale normalization schemes based on Tchebichef moments have been proposed to further improve the classification performance. An empirical study showed significant improvement in the numerical computation and classification accuracy with proposed method.

4.1 Introduction

In image normalization, images are mapped to a standard form known as the canonical form that possess a set of predefined moment values. The first significant paper to use moment normalization on discrete orthogonal moments is proposed by Goh et al. (2009). In this paper, the AST-invariants were proposed for unweighted Hahn moments. The scale coefficients were derived based on radius of gyration from geometric moments. On the other hand, Liu et al. (2011) proposed anisotropic scale invariants for Tchebichef moments. Together with the Tchebichef central moments (Zhu et al., 2007c), we obtain the AST invariants. The latter approach uses second order Tchebichef moments to determine the scale coefficients. In Section 4.2 both of the above mentioned methods have been reviewed. In Section 4.3, new AST-invariants using image normalization approach have been proposed. The proposed invariants consist of recurrence relations for fast computation and new sets of normalization schemes for better classification performance. Section 4.4 gives empirical verification to support the theoretical frameworks. Section 4.5 concludes the chapter.

4.2 Preliminaries for the Proposed Invariants

We first review some expressions that will be used in the later sections.

Suppose $\tilde{t}_n^N(x)$ denotes the Tchebichef polynomial and $c_{n,k}^N$ are coefficients of the corresponding polynomials

$$t_n^N(x) = \sum_{k=0}^n c_{n,k}^N x^k, \quad (4.1)$$

and $d_{k,n}^N$ denote the coefficients of Tchebichef polynomials such that

$$x^n = \sum_{j=0}^n d_{n,j}^N \tilde{t}_j^N(x), \quad x, n = 0, 1, \dots, N-1. \quad (4.2)$$

From the orthogonality property of Tchebichef polynomials $\tilde{t}_n^N(x)$, the coefficients $c_{n,k}^N$ and $d_{k,m}^N$ have the following relation

$$\sum_{k=m}^n c_{n,k}^N d_{k,m}^N = \delta_{n,m} \quad (4.3)$$

where $\delta_{n,m}$ denotes the Kronecker's delta that returns unity when $n = m$ and zero otherwise.

The three terms recurrence relation of Tchebichef polynomials, $\tilde{t}_n^N(x)$, can be expressed as

$$\begin{aligned} \tilde{t}_n^N(x) &= (x\tilde{A}_n^N + \tilde{B}_n^N)\tilde{t}_{n-1}^N(x) + \tilde{C}_n^N\tilde{t}_{n-2}^N(x), \\ n &= 2, 3, \dots, N-1 \end{aligned} \quad (4.4)$$

and

$$\tilde{t}_0^N(x) = \frac{1}{\sqrt{N}} \quad (4.5)$$

$$\tilde{t}_1^N(x) = (x\tilde{A}_1^N + \tilde{B}_1^N)\tilde{t}_0^N(x) \quad (4.6)$$

where

$$\tilde{A}_n^N = \frac{2}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (4.7)$$

$$\tilde{B}_n^N = \frac{(1-N)}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (4.8)$$

$$\tilde{C}_n^N = -\frac{(n-1)}{n} \sqrt{\frac{2n+1}{2n-3}} \sqrt{\frac{N^2 - (n-1)^2}{N^2 - n^2}}. \quad (4.9)$$

4.2.1 Anisotropic Scale and Translation Tchebichef Moment Invariants of Goh et. al.

Let the anisotropic scale and translation Tchebichef moment invariants of Goh et al. (2009) (AST-G) be defined as

$$I_{n,m}^{(\text{ast-G})} = |\hat{a}_1 \hat{b}_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(\hat{a}_1 x + \hat{a}_2) \tilde{t}_m^N(\hat{b}_1 y + \hat{b}_2) f(x, y). \quad (4.10)$$

From (4.1), we have

$$I_{n,m}^{(\text{ast-G})} = |\hat{a}_1 \hat{b}_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \sum_{k=0}^n c_{n,n-k}^N (\hat{a}_1 x + \hat{a}_2)^{n-k} \sum_{j=0}^m c_{m,m-j}^N (\hat{b}_1 y + \hat{b}_2)^{m-j} f(x, y). \quad (4.11)$$

By performing binomial expansion, and grouping of the coefficients for x^{n-k} and y^{m-j} , the invariant moment becomes

$$I_{n,m}^{(\text{ast-G})} = |\hat{a}_1 \hat{b}_1| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \sum_{k=0}^n \beta_{n,n-k}^{(1)} x^{n-k} \sum_{j=0}^m \beta_{m,m-j}^{(2)} y^{m-j} f(x, y) \quad (4.12)$$

where

$$\beta_{n,n-k}^{(1)} = \sum_{r=0}^k \binom{n-k+r}{r} c_{n,n-k+r}^N \hat{a}_2^r \hat{a}_1^{n-k} \quad (4.13)$$

$$\beta_{m,m-j}^{(2)} = \sum_{s=0}^j \binom{m-j+s}{s} c_{m,m-j+s}^N \hat{b}_2^s \hat{b}_1^{m-j}. \quad (4.14)$$

From (4.2), we have

$$x^n = \sum_{k=0}^n d_{n,n-k}^N \tilde{t}_{n-k}^N(x). \quad (4.15)$$

Thus the AST-G has the expression

$$I_{n,m}^{(\text{ast-G})} = |\hat{a}_1 \hat{b}_1| \sum_{k=0}^n \sum_{j=0}^m \tau_{n,n-k}^{(1)} \tau_{m,m-j}^{(2)} T_{n-k,m-j} \quad (4.16)$$

where

$$\tau_{n,n-k}^{(1)} = \sum_{r=0}^k \beta_{n,n-r}^{(1)} d_{n-r,n-k}^N \quad (4.17)$$

$$\tau_{m,m-j}^{(2)} = \sum_{s=0}^j \beta_{m,m-s}^{(2)} d_{m-s,m-j}^N. \quad (4.18)$$

4.2.2 Normalization Scheme for Anisotropic Scale and Translation Tchebichef Moment Invariants of Goh et. al.

The normalization of AST-G are determined by the radius of gyration of geometric moments (Goh et al., 2009). The normalization parameters are determined using any one of the following approach:

(A1) With a standard image or a set of standard moment values.

(A2) Without a set of standard moment values.

For the first approach, a set of moments including geometric moments up to first order, and central moments up to 3rd order are computed from the standard image. In case the standard moments are not provided, some prefixed values of K'_1 and K'_2 are required in the normalization process. This is summarized in Table 4.1.

Table 4.1: AST-G normalization for mapping function $x' = \hat{a}_1x + \hat{a}_2$ and $y' = \hat{b}_1y + \hat{b}_2$

	x'		y'	
	\hat{a}_1	\hat{a}_2	\hat{b}_1	\hat{b}_2
Translation only*	1	$\bar{x}' - \bar{x}$	1	$\bar{y}' - \bar{y}$
Scale only*	sc'_x/sc_x	0	sc'_y/sc_y	0
Translation and Scale*	sc'_x/sc_x	$\bar{x}' - (sc'_x/sc_x)\bar{x}$	sc'_y/sc_y	$\bar{y}' - (sc'_y/sc_y)\bar{y}$
Translation only [▲]	1	$K'_1 - \bar{x}$	1	$K'_1 - \bar{y}$
Scale only [▲]	K'_2/sc_x	0	K'_2/sc_y	0
Translation and Scale [▲]	K'_2/sc_x	$K'_1 - (K'_2/sc_x)\bar{x}$	K'_2/sc_y	$K'_1 - (K'_2/sc_y)\bar{y}$

* With standard moments

▲ Without standard moments

The radius of gyrations (with origin at image centroid):

$$|r_x| = \sqrt{\frac{\mu_{2,0}}{\mu_{0,0}}} \quad \text{and} \quad |r_y| = \sqrt{\frac{\mu_{0,2}}{\mu_{0,0}}}. \quad (4.19)$$

The skewness of image (with origin at image centroid):

$$s_x = \frac{\mu_{3,0}}{\mu_{2,0}^{\frac{3}{2}}} \quad \text{and} \quad s_y = \frac{\mu_{0,3}}{\mu_{0,2}^{\frac{3}{2}}}. \quad (4.20)$$

The scale factors are:

$$sc_x = \text{sign}(s_x)|r_x| \quad \text{and} \quad sc_y = \text{sign}(s_y)|r_y|. \quad (4.21)$$

The formulations for the radius of gyrations and the skewness of image, are equivalent to the definition stated in Chapter 2 with the condition that the origin is being shifted to the centroid of image.

In Goh et al. (2009), the coefficient values were recommended as

(B1) $K'_2 \in [0.5 \times N, 0.8 \times N]$, and

(B2) $K'_1 = 0$ which means the centroid of canonical forms are mapped to the origin.

4.2.3 Anisotropic Scale and Translation Tchebichef Moment Invariants of Liu et al.

The second set of anisotropic scale and translation invariants was proposed by Liu et al. (2011) (denoted as AST-L). In the paper, the scale invariants were initially proposed to solve affine Tchebichef moment invariants using XYS and XSR decompositions. The method is an extension on H. Zhang et al. (2011) where affine Legendre moments are proposed to resolve the geometric distortion of watermarked images. As the method requires the image's centroid to be located at the origin, the expression is thus AST invariant. According to Liu et al. (2011), the centroid is

$$\bar{x} = \frac{c_{0,0}^N T_{1,0} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}} \quad \text{and} \quad \bar{y} = \frac{c_{0,0}^N T_{0,1} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}}. \quad (4.22)$$

The Tchebichef moment

$$I_{n,m}^{(\text{ast-L})} = \sum_{k=0}^n \sum_{j=0}^m \sum_{r=0}^k \sum_{s=0}^j \tilde{a}_1^{k+1} \tilde{b}_1^{j+1} c_{n,k}^N c_{m,j}^N d_{k,r}^N d_{j,s}^N T_{r,s}^{(c)} \quad (4.23)$$

is AST-invariants if the scale parameters \tilde{a}_1 and \tilde{b}_1 satisfy the constraint

$$I_{2,0}^{(\text{ast-L})} = 1 = I_{0,2}^{(\text{ast-L})}$$

or the parameters, \tilde{a}_1 and \tilde{b}_1 are solutions of the system equations

$$\begin{aligned} (c_{2,2}^N d_{2,0}^N T_{0,0}^{(c)} + c_{2,2}^N d_{2,1}^N T_{1,0}^{(c)} + T_{2,0}^{(c)}) \tilde{a}_1^3 \tilde{b}_1 + (c_{2,1}^N d_{1,0}^N T_{0,0}^{(c)} \\ + c_{2,1}^N d_{1,1}^N T_{1,0}^{(c)}) \tilde{a}_1^2 \tilde{b}_1 + (c_{2,0}^N d_{0,0}^N T_{0,0}^{(c)}) \tilde{a}_1 \tilde{b}_1 = 1 \end{aligned} \quad (4.24)$$

$$\begin{aligned} (c_{2,2}^N d_{2,0}^N T_{0,0}^{(c)} + c_{2,2}^N d_{2,1}^N T_{0,1}^{(c)} + T_{0,2}^{(c)}) \tilde{a}_1 \tilde{b}_1^3 + (c_{2,1}^N d_{1,0}^N T_{0,0}^{(c)} \\ + c_{2,1}^N d_{1,1}^N T_{0,1}^{(c)}) \tilde{a}_1 \tilde{b}_1^2 + (c_{2,0}^N d_{0,0}^N T_{0,0}^{(c)}) \tilde{a}_1 \tilde{b}_1 = 1. \end{aligned} \quad (4.25)$$

By solving (4.24) and (4.25), the scale coefficients of \tilde{a} and \tilde{b} are found to be

$$\tilde{a}_1^2 = \frac{-A_3 \pm \sqrt{A_3^2 + 4\sqrt{A_1 B_1}}}{2A_1}, \quad \text{and} \quad (4.26)$$

$$\tilde{b}_1^2 = \frac{-A_3 \pm \sqrt{A_3^2 + 4\sqrt{A_1 B_1}}}{2B_1}. \quad (4.27)$$

where

$$\begin{aligned}
A_1 &= c_{2,2}^N d_{2,0}^N T_{0,0}^{(c)} + c_{2,2}^N d_{2,1}^N T_{1,0}^{(c)} + T_{2,0}^{(c)}, \\
A_2 &= c_{2,1}^N d_{1,0}^N T_{0,0}^{(c)} + c_{2,1}^N d_{1,1}^N T_{1,0}^{(c)}, \\
A_3 &= c_{2,0}^N d_{0,0}^N T_{0,0}^{(c)}, \\
B_1 &= c_{2,2}^N d_{2,0}^N T_{0,0}^{(c)} + c_{2,2}^N d_{2,1}^N T_{0,1}^{(c)} + T_{0,2}^{(c)}, \\
B_2 &= c_{2,1}^N d_{1,0}^N T_{0,0}^{(c)} + c_{2,1}^N d_{1,1}^N T_{0,1}^{(c)}.
\end{aligned}$$

The scale normalization can be further generalized by

$$I_{2,0}^{(\text{ast-L})} = \Omega_L = I_{0,2}^{(\text{ast-L})} \quad \text{where} \quad \Omega_L \in \Re.$$

The full solution on solving this system of equations is given in Appendix A.

As shown above, despite the pre-computation on coefficients of $c_{n,k}^N$ and $d_{k,m}^N$, AST-L is inefficient. This is mainly due to the sequential computation of central Tchebichef moments and scale normalization descriptors. AST-G on the other hand is much faster as the expressions do not require sequential computation of translation invariants and scale invariants. However pre-computation of $c_{n,k}^N$ and $d_{k,m}^N$ are required and additional double precision memories in total of

$$4 \times \frac{(p+1)(p+2)}{2}.$$

are required to store variables $c_{n,k}^N$, $d_{k,m}^N$, $\beta_{n,n-k}^{(1)}$ and $\beta_{m,m-j}^{(2)}$. Here p denotes the order of the AST-G moments.

4.3 Proposed Anisotropic Scale and Translation Tchebichef Moment Invariants

In this section, a new anisotropic scale and translation Tchebichef moment invariant algorithms will be proposed. For convenience, it will be denoted as AST-invariants with invariant descriptors $\{I_{n,m}^{(\text{ast})}\}$. The AST-invariants come with a fast computation algorithm using recurrence relation, and new sets of normalization schemes purely based on Tchebichef moments. The fast computational algorithms are given in Section 4.3.1. Theoretical framework in determining the normalization parameters are given in Section 4.3.2.

Definition 4.3.1. Suppose an anisotropic scale and translation transformation is defined as

$$\begin{aligned} x' &= a_1x + a_2 & \text{and} & & y' &= b_1y + b_2 \\ (x, y) &\in S_2(N_0) & \text{and} & & (x', y') &\in S_2(N_s) \end{aligned} \quad (4.28)$$

while the AST-invariant descriptors are defined as

$$\begin{aligned} I_{n,m}^{(\text{ast})} &= |a_1b_1| \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s}(a_1x + a_2) \tilde{t}_m^{N_s}(b_1y + b_2) f(x, y) \\ n, m &= 0, 1, \dots, \min(N_0 - 1, N_s - 1), \quad \text{and} \quad a_1, a_2, b_1, b_2 \in \mathfrak{R}. \end{aligned} \quad (4.29)$$

$S_2(N_0)$ and $S_2(N_s)$ denote the original and transformed image spaces, respectively. The two spaces are independent so that the invariant descriptors can be directly compute from original image without the need to re-mapped it to a prefixed space. This not only save the computer memory, it also speedup the calculation of image moments especially when large numbers of the images are small.

4.3.1 Recurrence Relation for Fast Computation of Anisotropic Scale and Translation Invariants

The recurrence relations for fast computation of AST-invariants are given by the following theorem.

Theorem 4.3.1.

$$I_{n,m}^{(\text{ast})} = |a_1b_1| \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)} \lambda_{m,j}^{(2)} T_{k,j}. \quad (4.30)$$

if

$$\begin{aligned} \lambda_{n,k}^{(1)}(a_1, a_2; N_0, N_s) &= \lambda_{n-1,k-1}^{(1)} a_1 K_{n,k}^{N_s, N_0} + \lambda_{n-1,k}^{(1)} \tilde{A}_n^{N_s} \left(a_2 - \frac{(N_s - 1)}{2} + \frac{a_1(N_0 - 1)}{2} \right) \\ &\quad - \lambda_{n-1,k+1}^{(1)} a_1 K_{n,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} + \lambda_{n-2,k}^{(1)} \tilde{C}_n^{N_s} \end{aligned} \quad (4.31)$$

$$\begin{aligned} \lambda_{m,j}^{(2)}(b_1, b_2; N_0, N_s) &= \lambda_{m-1,j-1}^{(2)} b_1 K_{m,j}^{N_s, N_0} + \lambda_{m-1,j}^{(2)} \tilde{A}_m^{N_s} \left(b_2 - \frac{(N_s - 1)}{2} + \frac{b_1(N_0 - 1)}{2} \right) \\ &\quad - \lambda_{m-1,j+1}^{(2)} b_1 K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} + \lambda_{m-2,j}^{(2)} \tilde{C}_m^{N_s} \end{aligned} \quad (4.32)$$

where

$$K_{i,j}^{M,N} = \frac{\tilde{A}_i^M}{\tilde{A}_j^N} \quad (4.33)$$

and

$$\tilde{A}_n^{N_*} = \frac{2}{n} \sqrt{\frac{4n^2 - 1}{N_*^2 - n^2}} \quad (4.34)$$

$$\tilde{B}_n^{N_*} = \frac{(1 - N_*)}{n} \sqrt{\frac{4n^2 - 1}{N_*^2 - n^2}} \quad (4.35)$$

$$\tilde{C}_n^{N_*} = -\frac{(n-1)}{n} \sqrt{\frac{2n+1}{2n-3}} \sqrt{\frac{N_*^2 - (n-1)^2}{N_*^2 - n^2}} \quad (4.36)$$

$N_* = N_0 \text{ or } N_s.$

Proof. For the zero and first degree normalized Tchebichef polynomials, $\tilde{t}_0^{N_s}(a_1x + a_2)$, and $\tilde{t}_1^{N_s}(a_1x + a_2)$, it is easy to show that

$$t_0^{N_s}(a_1x + a_2) = \sqrt{\frac{N_0}{N_s}} t_0^{N_0}(x) \quad (4.37)$$

and

$$\begin{aligned} t_1^{N_s}(a_1x + a_2) &= a_1 K_{1,1}^{N_s, N_0} \sqrt{\frac{N_0}{N_s}} \tilde{t}_1^{N_0}(x) + \\ &\quad \left(a_2 - \frac{(N_s - 1)}{2} + \frac{a_1(N_0 - 1)}{2} \right) \sqrt{\frac{N_0}{N_s}} \tilde{A}_1^{N_s} \tilde{t}_0^{N_0}(x) \end{aligned} \quad (4.38)$$

which are linear combinations of first n -degrees original Tchebichef polynomials $\tilde{t}_n^{N_0}(x)$.

In this case, n has values 0 and 1.

By induction, suppose

$$\tilde{t}_p^{N_s}(a_1x + a_2) = \sum_{k=0}^p \lambda_{p,k}^{(1)}(a_1, a_2; N_0, N_s) \tilde{t}_k^{N_0}(x) \quad (4.39)$$

for $p = 0, 1, \dots, n$, we now consider $\tilde{t}_{n+1}^{N_s}(a_1x + a_2)$.

From the three terms recurrence relation of (4.4), we have

$$\tilde{t}_{n+1}^{N_s}(a_1x + a_2) = [(a_1x + a_2)\tilde{A}_{n+1}^{N_s} + \tilde{B}_{n+1}^{N_s}]\tilde{t}_n^{N_s}(a_1x + a_2) + \tilde{C}_{n+1}^{N_s}\tilde{t}_{n-1}^{N_s}(a_1x + a_2). \quad (4.40)$$

By the induction hypothesis in (4.39), we get

$$\begin{aligned} \tilde{t}_{n+1}^{N_s}(a_1x + a_2) &= \sum_{k=0}^n \left\{ \lambda_{n,k}^{(1)} \left[\tilde{A}_{n+1}^{N_s} a_2 + \tilde{B}_{n+1}^{N_s} \right] + \lambda_{n-1,k}^{(1)} \tilde{C}_{n+1}^{N_s} \right\} \tilde{t}_k^{N_0}(x) \\ &\quad + a_1 K_{n+1,i+1}^{N_s, N_0} \tilde{A}_{k+1}^{N_0} x \sum_{k=0}^n \lambda_{n,k}^{(1)} \tilde{t}_k^{N_0}(x). \end{aligned} \quad (4.41)$$

The variable “ x ” can be eliminated using the three terms recurrence relation in (4.4).

Therefore we have

$$\begin{aligned} \tilde{t}_{n+1}^{N_s}(a_1x + a_2) &= \sum_{k=0}^{n+1} \left\{ \lambda_{n,k-1}^{(1)} a_1 K_{n+1,k}^{N_s, N_0} + \lambda_{n,k}^{(1)} \tilde{A}_{n+1}^{N_s} \left(a_2 - \frac{(N_s - 1)}{2} + \frac{a_1(N_0 - 1)}{2} \right) \right. \\ &\quad \left. - \lambda_{n,k+1}^{(1)} a_1 K_{n+1,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} + \lambda_{n-1,k}^{(1)} \tilde{C}_{n+1}^{N_s} \right\} \tilde{t}_k^{N_0}(x) \end{aligned} \quad (4.42)$$

which proved the recurrence relation (4.31).

The proof for (4.32) is similar. \square

Theoretically, to preserve orthogonality, the domain of standard image function must be within the space of orthogonal basis - $S_2(N_s)$. Thus some of the current normalization schemes are not suitable. In next section the new normalization scheme of AST for spatial displacement deformations and scale deformations will be proposed.

4.3.2 Spatial Displacement Normalization of Anisotropic Scale and Translation Invariants

As mentioned by Goh et al. (2009) and Liu et al. (2011), for translation invariants, both of the algorithms recommend the use of origin as centroid for their canonical images. However from the definition of centrally transformed Tchebichef polynomials $\tilde{t}_n^N(x - \bar{x})$, at least half of the values of $x - \bar{x}$ are outside the domain of basis function. This thus caused ambiguity regarding the orthogonality of canonical form. In addition, since the Tchebichef polynomials are symmetric functions with centre of symmetry at $\frac{N-1}{2}$. To have features with good discriminative power, the centroid of images should be near to or at the point of $\frac{N-1}{2}$. For that, the following lemma and theorem are derived to identify the suitable centroid location of the standard images.

Lemma 4.3.2. *Suppose f is the image defined in space of $S_2(N)$, the image's centroid (\bar{x}, \bar{y}) is*

$$\bar{x} = \frac{T_{0,1} - \tilde{B}_1^N T_{0,0}}{\tilde{A}_1^N T_{0,0}} \text{ and } \bar{y} = \frac{T_{1,0} - \tilde{B}_1^N T_{0,0}}{\tilde{A}_1^N T_{0,0}}. \quad (4.43)$$

Proof. From (4.5) and (4.6), we have

$$T_{1,0} = \frac{\tilde{A}_1^N}{N} m_{1,0} + \tilde{B}_1^N T_{0,0}, \quad (4.44)$$

$$T_{0,0} = \frac{m_{0,0}}{N} \quad (4.45)$$

where $m_{p,q} = \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} x^p y^q f(x, y)$ is the geometric moment.

Thus we have

$$\bar{x} = \frac{m_{1,0}}{m_{0,0}} = \frac{T_{1,0} - \tilde{B}_1^N T_{0,0}}{\tilde{A}_1^N T_{0,0}} \quad (4.46)$$

The similar approach can be used to find \bar{y} . \square

This Lemma 4.3.2 has the following important implication.

Theorem 4.3.3. *Suppose f denotes the image defined in the space of $S_2(N)$, the first order Tchebichef moments*

$$T_{1,0} = T_{0,1} = 0 \quad (4.47)$$

if and only if

$$\bar{x} = \bar{y} = \frac{(N-1)}{2}. \quad (4.48)$$

With this theorem, we may let the centroid of canonical images to be at the middle of $S_2(N_s)$, i.e. $\left(\frac{N_s-1}{2}, \frac{N_s-1}{2}\right)$. This is indeed the best location to ensure the canonical images are within the defined space. The constraint $T_{1,0} = T_{0,1} = 0$ is also useful to simplify the derivation of normalization expressions later.

4.3.3 Scale Normalization of Anisotropic Scale and Translation Invariants

As shown in Table 4.1, the scale normalization scheme proposed by Goh et al. (2009) is based on geometric moments which has incurred additional overhead in numerical computations. Liu et al. (2011) on the other hand uses the conditions of both the second order invariants $I_{0,2}^{(ast-L)}$ and $I_{2,0}^{(ast-L)}$ are equal to unity. However the method was derived with condition of canonical centroid at the origin. As such it is not compatible with our approach. Therefore we propose several normalization schemes based on Tchebichef moments. This gives flexibility in implementing the algorithms and eliminating the overhead caused by determining parameters from other domains.

Suppose the centroid of canonical image is at the middle of $S_2(N_s)$, the scale coefficient can be determined with one of the following conditions

- (C1) Anisotropic scale normalization using second order Tchebichef moment invariants,
- (C2) Anisotropic scale normalization using zero order and second order Tchebichef moment invariants,
- (C3) Anisotropic scale normalization using ratio of second order and zero order Tchebichef moment invariants.

4.3.3 (a) Anisotropic Scale Normalization using Second Order Tchebichef Moment Invariants

In this normalization scheme, the second order invariants are equal to a constant Ω_1

$$I_{2,0}^{(\text{ast})} = \Omega_1 = I_{0,2}^{(\text{ast})}. \quad (4.49)$$

This is the generalization of the method proposed by Liu et al. (2011). However the two methods do not show the same result. This is mainly due to the spatial displacement normalization being not identical.

From Theorem 4.3.1, the normalized moment invariants $I_{2,0}^{(\text{ast})}$ and $I_{0,2}^{(\text{ast})}$ have the following expressions:

$$I_{2,0}^{(\text{ast})} = a_1^3 b_1 \left(\frac{N_0}{N_s} \right) P_1 + a_1 b_1 \left(\frac{N_0}{N_s} \right) \tilde{C}_2^{N_s} T_{0,0} \quad (4.50)$$

$$I_{0,2}^{(\text{ast})} = a_1 b_1^3 \left(\frac{N_0}{N_s} \right) P_2 + a_1 b_1 \left(\frac{N_0}{N_s} \right) \tilde{C}_2^{N_s} T_{0,0} \quad (4.51)$$

where

$$P_1 = \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{2,0} + 2 \left(\frac{N_0 - 1}{2} - \bar{x} \right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{1,0} + \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0 - 1}{2} - \bar{x} \right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\} \quad (4.52)$$

$$P_2 = \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{0,2} + 2 \left(\frac{N_0 - 1}{2} - \bar{y} \right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{0,1} + \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0 - 1}{2} - \bar{y} \right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\}. \quad (4.53)$$

The derivation of $I_{2,0}^{(\text{ast})}$ and $I_{0,2}^{(\text{ast})}$ are given in Appendix B.

From (4.50) and (4.51), using the constraints $I_{2,0}^{(\text{ast})} = I_{0,2}^{(\text{ast})}$, we get

$$a_1 = \pm b_1 \sqrt{\frac{P_2}{P_1}}. \quad (4.54)$$

From (4.54) and the constraint $I_{2,0}^{(\text{ast})} = \Omega_1$, we get

$$a_1^4 P_1^2 + P_1 \tilde{C}_2^{N_s} T_{0,0} a_1^2 - \Omega_1 \left(\frac{N_s}{N_0} \right) \sqrt{P_1 P_2} = 0 \quad (4.55)$$

which has solutions

$$a_1^2 = \frac{-\tilde{C}_2^{N_s} T_{0,0} \pm \sqrt{\left(\tilde{C}_2^{N_s} T_{0,0} \right)^2 + 4 \Omega_1 \left(\frac{N_s}{N_0} \right) \sqrt{P_1 P_2}}}{2 P_1} \quad (4.56)$$

and

$$b_1^2 = \frac{-\tilde{C}_2^{N_s} T_{0,0} \pm \sqrt{\left(\tilde{C}_2^{N_s} T_{0,0}\right)^2 + 4\Omega_1 \left(\frac{N_s}{N_0}\right) \sqrt{P_1 P_2}}}{2P_2}. \quad (4.57)$$

In order to have real solution, the following condition is required

$$\Omega_1 \geq -\frac{\left(\tilde{C}_2^{N_s} T_{0,0}\right)^2}{4\sqrt{P_1 P_2}} \left(\frac{N_0}{N_s}\right) = \hat{\Omega}_1. \quad (4.58)$$

In this normalization scheme, with a prefixed value on Ω_1 , the canonical images are scaled proportional to the transformed space $S_2(N_s)$. This has been confirmed experimentally. With this, we can ensure that, the standard images will be consistently within the specific ranges of $S_2(N_s)$ regardless the variation of the transformed space.

4.3.3 (b) *Anisotropic Scale Normalization using Zero Order and Second Orders Tchebichef Moment Invariants.*

In this scheme, we use

$$I_{0,0}^{\langle \text{ast} \rangle} = \Omega_0 N_s \quad (4.59)$$

to control the size of normalized image while the second order moment invariants

$$I_{2,0}^{\langle \text{ast} \rangle} = I_{0,2}^{\langle \text{ast} \rangle}$$

is used to eliminate the anisotropic scale deformation.

From

$$I_{0,0}^{\langle \text{ast} \rangle} = |a_1 b_1| T_{0,0} \left(\frac{N_0}{N_s}\right) \quad (4.60)$$

we have

$$a_1 b_1 = \frac{\Omega_0}{T_{0,0}} \left(\frac{N_s^2}{N_0}\right). \quad (4.61)$$

From (4.61) and (4.54), we have

$$a_1^2 = \frac{\Omega_0}{T_{0,0}} \left(\frac{N_s^2}{N_0}\right) \times \sqrt{\frac{P_2}{P_1}} \quad (4.62)$$

$$b_1^2 = \frac{\Omega_0}{T_{0,0}} \left(\frac{N_s^2}{N_0}\right) \times \sqrt{\frac{P_1}{P_2}}. \quad (4.63)$$

As shown in (4.59), the scale coefficient Ω_0 is the ratio of canonical image's mass in relative to the transformed space $S_2(N_s)$. Therefore with a prefixed Ω_0 , the canonical image will be scaled proportional to the transformed space automatically.

4.3.3 (c) Anisotropic Scale Normalization using Ratio of Second Order and Zero Order Tchebichef Moment Invariants

With the centroid of canonical image at the middle of the image space, the ratio of second order moment invariants $I_{2,0}^{(ast)}$ with respect to $I_{0,0}^{(ast)}$, and the ratio of $I_{0,2}^{(ast)}$ with respect to $I_{0,0}^{(ast)}$ are identical to the radius of gyration of geometric moments with centroid at the origin.

Suppose

$$\frac{I_{2,0}^{(ast)}}{I_{0,0}^{(ast)}} = \Omega_a \quad \text{and} \quad \frac{I_{0,2}^{(ast)}}{I_{0,0}^{(ast)}} = \Omega_b. \quad (4.64)$$

For $\frac{I_{2,0}^{(ast)}}{I_{0,0}^{(ast)}} = \Omega_a$, from (4.50) and (4.61), we get

$$\frac{a_1^3 b_1 \left(\frac{N_0}{N_s}\right) P_1 + a_1 b_1 \tilde{C}_2^{N_s} \left(\frac{N_0}{N_s}\right) T_{0,0}}{a_1 b_1 T_{0,0} \left(\frac{N_0}{N_s}\right)} = \Omega_a \quad (4.65)$$

which have

$$P_1 a_1^2 + \tilde{C}_2^{N_s} T_{0,0} = \Omega_a T_{0,0}. \quad (4.66)$$

For simplicity, suppose

$$\Omega_a = \tilde{\Omega}_a \tilde{C}_2^{N_s}, \quad \tilde{\Omega}_a < 1 \quad (4.67)$$

we get

$$a_1 = \pm \sqrt{\frac{-T_{0,0} \tilde{C}_2^{N_s} (1 - \tilde{\Omega}_a)}{P_1}}. \quad (4.68)$$

Similarly for $\frac{I_{0,2}^{(ast)}}{I_{0,0}^{(ast)}} = \Omega_b$, by applying the same process, we can show that

$$b_1 = \pm \sqrt{\frac{-T_{0,0} \tilde{C}_2^{N_s} (1 - \tilde{\Omega}_b)}{P_2}} \quad (4.69)$$

and

$$\Omega_b = \tilde{\Omega}_b \tilde{C}_2^{N_s}, \quad \tilde{\Omega}_b < 1. \quad (4.70)$$

Similar to first and second normalization schemes, with prefixed values of $\tilde{\Omega}_a$ and $\tilde{\Omega}_b$, the canonical image will be scaled proportional to transformed space $S_2(N_s)$ automatically.

4.3.4 Uniqueness Issue of Anisotropic Scale and Translation Invariants

As shown in the preceding section, solutions of scale coefficients a_1 and b_1 have ambiguities in the signs. These are mainly caused by the mirror reflection on x -axis and y -axis. To remove the ambiguities, the following lemma is required.

Lemma 4.3.4. Suppose f , g_1 and g_2 are images in $S_2(N)$ with centroid at the middle of space and

$$g_1 \left(a(x - \bar{x}) + \frac{N-1}{2}, y \right) = f(x, y) \quad (4.71)$$

$$g_2 \left(x, b(y - \bar{y}) + \frac{N-1}{2} \right) = f(x, y), \quad a, b \in \mathfrak{R}. \quad (4.72)$$

1. If $T_{1,2}(f) \geq 0$, then

$$T_{1,2}(g_1) \leq 0, \text{ if and only if } a < 0. \quad (4.73)$$

2. If $T_{2,1}(f) \geq 0$, then

$$T_{2,1}(g_2) \leq 0, \text{ if and only if } b < 0. \quad (4.74)$$

Proof. We first consider $T_{1,2}(g_1)$. From definition, we have

$$T_{1,2}(g_1) = |a| \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_1^N \left(a(x - \bar{x}) + \frac{N-1}{2} \right) \tilde{t}_2^N(y) f(x, y). \quad (4.75)$$

From (4.6) and the condition of $\bar{x} = \frac{N-1}{2}$ we can deduce that

$$\tilde{t}_1^N \left(a(x - \bar{x}) + \frac{N-1}{2} \right) = a \tilde{t}_1^N(x). \quad (4.76)$$

By substituting (4.76) into (4.75),

$$T_{1,2}(g_1) = a|a|T_{1,2}(f). \quad (4.77)$$

As $T_{1,2}(f) \geq 0$, thus we have $T_{1,2}(g_1) \leq 0$ if and only if $a \leq 0$.

The proof is similar for (4.74). □

The image g_1 denotes the image f which is scaled by coefficient a relative to middle of space, in x -axis direction. g_2 on the other hand is the f scaled by coefficient b relative to middle of space, in y -axis direction. The above lemma provides us the theoretical basis to determine the direction of scale coefficients on f using the descriptors $I_{1,2}^{(\text{ast})}$ and $I_{2,1}^{(\text{ast})}$. By having

$$a = \text{sign} \left[I_{1,2}^{(\text{ast})} \right] |a| \quad (4.78)$$

$$b = \text{sign} \left[I_{2,1}^{(\text{ast})} \right] |b| \quad (4.79)$$

where $\text{sign}(x)$ denotes function return value 1 if $x \geq 0$, and return -1 if otherwise. We therefore resolve the ambiguities caused by the mirror reflections.

We are now ready to solve the uniqueness issues of AST-invariants using the following theorem.

Theorem 4.3.5. *Suppose $g(a_3x + a_4, b_3y + b_4) = f(x, y)$, where a_3, a_4, b_3 , and $b_4 \in \mathfrak{R}$, then*

$$I_{n,m}^{(\text{ast})}(f) = I_{n,m}^{(\text{ast})}(g),$$

$$n, m = 0, 1, \dots, \min(N_0 - 1, N_s - 1) \quad (4.80)$$

if the invariants $I_{n,m}^{(\text{ast})}(f)$ and $I_{n,m}^{(\text{ast})}(g)$ satisfy all the following conditions

1. $I_{1,0}^{(\text{ast})}(\ast) = I_{0,1}^{(\text{ast})}(\ast)$
2. One of the scale normalization schemes in Section 4.3.3
3. $I_{1,2}^{(\text{ast})}(\ast) \geq 0$ and $I_{2,1}^{(\text{ast})}(\ast) \geq 0$

where $\ast \in \{f, g\}$.

Proof. Suppose

$$x_1 = a_3x + a_4 \quad \text{and} \quad y_1 = b_3y + b_4, \quad (4.81)$$

$f'(x_f, y_f)$ denotes the AST transformed of image f , with

$$x_f = a_1x + a_2 \quad \text{and} \quad y_f = b_1y + b_2, \quad (4.82)$$

and $g'(x_g, y_g)$ is the AST transformed of image g , with

$$x_g = a'_1x_1 + a'_2 \quad \text{and} \quad y_g = b'_1y_1 + b'_2. \quad (4.83)$$

From (4.81), we get

$$x_g = a'_1a_3x + a'_1a_4 + a'_2 \quad \text{and} \quad y_g = b'_1b_3y + b'_1b_4 + b'_2. \quad (4.84)$$

Thus AST-invariants of f and g have the following expressions

$$I_{n,m}^{(\text{ast})}(f) = |a_1b_1| \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)f}(a_1, a_2; N_0, N_s) \times$$

$$\lambda_{m,j}^{(2)f}(b_1, b_2; N_0, N_s) T_{k,j}(f) \quad (4.85)$$

and

$$I_{n,m}^{(\text{ast})}(g) = |a'_1 a_3 b'_1 b_3| \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)g}(a'_1 a_3, a'_1 a_4 + a'_2; N_0, N_s) \times \lambda_{m,j}^{(2)g}(b'_1 b_3, b'_1 b_4 + b'_2; N_0, N_s) T_{k,j}(f). \quad (4.86)$$

This means that $I_{n,m}^{(\text{ast})}(f) = I_{n,m}^{(\text{ast})}(g)$ if all the following conditions are satisfied

$$a_1 = a'_1 a_3 \quad (4.87)$$

$$a_2 = a'_1 a_4 + a'_2 \quad (4.88)$$

$$b_1 = b'_1 b_3 \quad (4.89)$$

$$b_2 = b'_1 b_4 + b'_2. \quad (4.90)$$

Conditions (4.87) and (4.89) can be deduced by any of the scale normalization schemes in Sections 4.3.3 (a), 4.3.3 (b) and 4.3.3 (c), and the Lemma 4.3.4. From (4.87) and (4.89) and using the properties of f' and g' centred at the middle of $S_2(N_s)$, we can prove the conditions (4.88) and (4.90).

As conditions (4.87) to (4.90) are all satisfied, the theorem is proved. \square

4.3.5 The Skewed Anisotropic Scale and Translated Tchebichef Moment Invariants

Skew coefficients (w_x, w_y) can be used to improve the feature accuracy and enhance classifications performance. Therefore the proposed AST-invariants finally have expression

$$I_{n,m}^{(\text{ast})} = |a_1 b_1| \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)}(s_x |a_1|, -s_x |a_1| \bar{x} + \frac{N_s - 1}{2} + w_x; N_0, N_s) \times \lambda_{m,j}^{(2)}(s_y |b_1|, -s_y |b_1| \bar{y} + \frac{N_s - 1}{2} + w_y; N_0, N_s) \times T_{k,j} \\ n, m = 0, 1, \dots, \min \left\{ \frac{(N_0 - 1)}{2}, \frac{(N_s - 1)}{2} \right\}. \quad (4.91)$$

where the skew parameters (w_x, w_y) are some constant in unit of pixels, and $s_x = \text{sign} \left[I_{1,2}^{(\text{ast})} \right]$ and $s_y = \text{sign} \left[I_{2,1}^{(\text{ast})} \right]$.

4.4 Experimental Studies

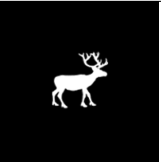

In this section, empirical supports are given for the theoretical framework discussed in previous sections. In the first subsection, normalization parameters are estimated so

that orthogonality of the transformed images can be preserved whichever possible by using the proposed normalization scheme. In the second subsection, the accuracy of AST invariant descriptors are evaluated. This is followed by the evaluation of the numerical computational performance between the AST invariant algorithms. In the forth subsection, the robustness of AST-invariant features relative to noise have been studied. Finally sets of similar Chinese handwritten characters are used to evaluate the discriminative power of the features generated by different AST invariant algorithms.

4.4.1 Parameters Determination for Anisotropic Scale and Translation Invariants

In this experiment, a set of images with different complexities, representing groups of animals, company logos, characters, numbers, symbols and Chinese characters are used to determine the scale normalization parameters. The images are listed in Table 4.2. The size of each image is 70×70 pixels and both original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are set to be equal to $S_2(200)$.

Table 4.3 gives the output of normalized images using the first scale normalization scheme. As shown in the table, when the scale coefficient $\Omega_1 < 0$, the size of the image is larger when Ω_1 is negative in decreasing magnitude. On the other hand, the image size is monotonically increasing for $\Omega_1 \geq 0$. Ideally, the best scale coefficients would be from $\Omega_1 < 0$. However as shown by (4.58), pre-computation is required to avoid imaginary solutions. Hence the best possible scale coefficient for the first normalization scheme

would be for

$$0 \leq \Omega_1 \leq 1. \quad (4.92)$$

Table 4.5 gives the output using the second scale normalization scheme. The size of the images in this case is determined by coefficient $\Omega_0 = \frac{l_{0,0}^{(ast)}}{N_s}$ which is equivalent to the mass for binary images in relative to the area of $S_2(N_s)$. In this experiment, the suitable scale parameter values are found to be within the range of

$$0.05 \leq \Omega_0 \leq 0.2. \quad (4.93)$$

In the third normalization scheme, the scale coefficients are determined by the ratio between second order moments and zero order moment. As shown in Table 4.7, the range for suitable scale coefficients are

$$0.5 \leq \tilde{\Omega}_a, \tilde{\Omega}_b \leq 0.7. \quad (4.94)$$

Generally, the recommended parameter values will ensure a good classification performance. However it does not guarantee the best classification result. In the situation where centroid is near to the middle of transformed space $S_2(N_s)$, slight deviations of size might also bring better classification performance. Similarly, the use of smaller size canonical images does not imply a poor classification performance. This can be explained by the fact that the normalization process does not involve actual physical transformation and there is no loss of information. The process is just a transformation of original moments to match the moments of canonical form. As long as the major parts of canonical image is defined within the space of basis functions, the deviations with respect to classification performance is negligible. However in situations where the centroid of canonical image is deviated far from the middle of transformed space $S_2(N_s)$, the orthogonality property is no longer holds and the within class separation is degraded by skewing process which thus compromised the classification performance.

We next evaluate the performance of the normalization schemes from the aspect of size variations of the output images. As shown in Tables 4.4, 4.6 and 4.8, the average size deviations of the first, second and third scale normalization schemes, are 46.154% , 27.793% and 16.162%, respectively. This shows that the second order moments are not

suitable in controlling the size of the output images. The zero order moments appeared to be better than the second order moments. However size of canonical image is heavily affected by distribution of the image itself. This is showed by the images “mercedes”, and “zeta” in Table 4.6. As the images are low in density distributions, it is unavoidable for the normalized images to take up wider space. Therefore the third normalization scheme is the best scale normalization scheme comparatively. This is mainly due to the zero order and second order moments to certain extent are correlated. Therefore the ratio between the second order and zero order Tchebichef moments can be effectively used to reduce the variations of size of output images.

4.4.2 Accuracy of Invariant Descriptors

In this section, we evaluate the accuracy of the proposed anisotropic scale and translation invariant. In the experiment, both original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are equal to $S_2(250)$. A set of 80×80 pixels binary images in different complexity, symmetric and non-symmetric are selected for this experiment. As shown in Table 4.9, the images are non-uniformly expanded, contracted, or reflected, and arbitrary shifted from the middle of the domain. The invariants descriptors AST(1), AST(2), and AST(3), shown in Tables 4.10, 4.11 and 4.12 denote the AST-invariants features that use first, second and third scale normalization schemes, respectively to eliminate the size deformations. Accuracy of AST-G and AST-L are included in Tables 4.13 and 4.14 for the purpose of comparison. Overall the invariant descriptors exhibit high computational accuracy. Similar to algebraic cancellation approach, the odd order of moment invariants or the moments with relatively small values are more vulnerable to both re-sampling errors and discretization errors caused by the spatial deformations. This is due to anti-symmetric property of the basis function. When the image centroid is near to the center of symmetry, a small deviation on image values will significantly compromise the accuracy of the invariants descriptors. The accuracy of AST-L is far superior compared with others. The high precision of AST-L features can be explained by the deviation of the images from middle of space using Tchebichef central moments. Similar performance can be achieved by any of the AST algorithms when the centroid of images are shifted to the origin using skew parameters as shown in Table 4.15.

4.4.3 Numerical Efficiency

In this section, the computational efficiency of the proposed method in comparison with AST-G, AST-L and AST-Z has been evaluated. The program was implemented in Matlab 2011b, on Intel i3 550 processor with 3.2GHz, 3GB of RAM. In this experiment, images with size 50×50 , 100×100 , 150×150 , and 200×200 pixels were used to generate invariant features with orders of 10, 20, 30 and 40. The experiment was repeated 200 times and the average CPU elapse times in millisecond were recorded. From Table 4.16, excluding the moment generation time, on average, the efficiency of the proposed method is about 5.44 times and 91.88 times faster than AST-G and AST-L, respectively. The significant improvement in performance are mainly due to the simplicity of the new recurrence relations. AST-L and AST-Z are inefficient mainly due to complexity of hypergeometric functions involved. The sequential computation on translation invariants followed by anisotropic scale invariants further slowdown the calculation of the invariant descriptors.

Table 4.16: Comparison of CPU elapse time (ms) for AST invariants algorithms

Image Size	Order of descriptors	Proposed Method				AST-G			AST-L			AST-Z(1)	
		Moments generation times (ms)	Invariant generation times (ms)	Total time (ms)	Invariant generation times (ms)	Invariant generation times (ms)	Total time (ms)	Invariant generation times (ms)	Invariant generation times (ms)	Total time (ms)	Invariant generation times (ms)	Invariant generation times (ms)	Total time (ms)

4.4.4 Robustness to Noise

Noise has an adverse effect on the invariance of moments. This is due to the difficulty in determining the accurate normalizing parameters such as the centroid (\bar{x}, \bar{y}) , and the scale coefficients a_1 and a_2 under noisy condition. Since the normalizing parameters are important for mapping the transformed image to a standard normalized form, the invariance of the moments is directly affected in the presence of noise. In this experiment, the performance of AST is tested. For the purpose of comparison, AST-G, AST-L, AST-Z, and AST-P are also shown. The following features are used for the recognition task

$$\mathbf{V} = [I_{0,0}, I_{2,0}, I_{0,2}, I_{3,0}, I_{1,2}, I_{2,1}, I_{0,3}]^T \quad (4.95)$$

where $I_{n,m}$ denotes the AST-Invariants defined in the previous section. In this experiment, the square of Euclidean distance is utilized as the classification measures.

$$d(\tilde{\mathbf{V}}_s, \tilde{\mathbf{V}}_t^{(k)}) = \sum_{j=1}^J (\tilde{v}_{s,j} - \tilde{v}_{t,j}^{(k)})^2, \quad (4.96)$$

where $\tilde{\mathbf{V}}_s$ is the J -dimensional scaled feature vectors of unknown sample, and $\tilde{\mathbf{V}}_t^{(k)}$ is the scaled training vector of class k . The scaled feature vectors are used mainly to remove large dynamic range on moments values. The scaled formula is as follows:

$$\tilde{v}_{s,j} = \frac{v_{s,j} - \min_k v_{t,j}^{(k)}}{\max_k v_{t,j}^{(k)} - \min_k v_{t,j}^{(k)}}. \quad (4.97)$$

The recognition accuracy, η , is defined as

$$\eta = \frac{\text{Number of correctly classified images}}{\text{Total number of images used in the test}}. \quad (4.98)$$

The numbers and upper case letters “0”, “5”, “B”, “F”, “I”, “J”, “O”, and “S” from Figure 4.1 are used as the training set. The size of each training image is 80×80 pixels. Both of the original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are equal to $S_2(251)$. The testing set is generated by scaling and translating the training set with scale factors $a_1, b_1 \in \{-1.5, -1, -0.5, 0.5, 1, 1.5\}$ and translation parameters $a_2, b_2 \in \{-1, 0, 1\}$. The transformation forms a testing set of 2,592 images. This is followed by adding salt-and-pepper noise with different noise densities. Figure 4.2 shows some of the testing images contaminated by 1% to 4% of salt-and-pepper noise.

Figure 4.1: Binary images as training set for experiment on character recognition.

Figure 4.2: Part of the images in the testing set.

Table 4.17: Classification Result of image with translation and scale transformation

Salt & pepper	AST(3)*	AST(3)-W*	AST-G	AST-Z	AST-P	AST-L
No noise	100.00%	100.00%	98.61%	100.00%	100.00%	75.00%
1%	75.89%	26.89%	35.80%	71.61%	71.61%	30.25%
2%	72.99%	26.42%	35.29%	65.09%	65.09%	20.87%
3%	71.91%	27.74%	35.15%	60.84%	60.84%	19.60%
4%	69.95%	27.01%	36.30%	58.91%	58.91%	19.33%

AST(3)* denotes AST using the 3rd—scale normazation scheme

AST(3)-W* denotes AST(3) with centroid at the origin.

Table 4.17 shows the feature vectors are used to classify these images and recognition accuracy is compared with others AST-invariant algorithms.

In this experiment, AST(3) denotes the AST-invariants using the third scaling normalization scheme with scale coefficients $\tilde{\Omega}_a = \tilde{\Omega}_b = 0$, and skew parameters set to $(w_x, w_y) = (-10, 0)$. As follow the recommendation of Goh et al. (2009), the scale coefficient of AST-G is set to $K'_2 = 0.6 \times N_s$ (to compliant with the recommended range $[0.5N_s, 0.8N_s]$), and $K'_1 = 0$. As shown in Table 4.17, AST-L, AST-W and AST-G have the three lowest in classification performance. The poor performance is mainly due to ambiguity caused by shifting of centroid away from the middle of transformed space $S_2(N_s)$. The explanation is supported by the poor performance shown by AST(3)-W, from which, in this case the scale parameter is identical to AST(3), however the image centroid is shifted to origin by the skew parameters. AST-Z which have the identical performance when compared with AST-P confirmed the strong correlation between the two algorithms.

4.4.5 Recognition of Similar Chinese Handwritten Characters

In this subsection, the discriminative power of AST-invariants features are evaluated using Chinese handwritten characters. For this purpose, the HCL2000 database (H. Zhang, Guo, Chen, & Li, 2009) is selected; this database consists of large amount of very similar Chinese handwritten characters written by 1,000 different writers. As shown in Figure 4.3, nine pairs of very similar Chinese handwritten characters each differing by one stroke in nine different zones are selected for this experiment. Figures 4.4 and 4.5 show some of the randomly selected images that are used in the experiment. The database is separated into two groups. The group with label of "hh" consists of character sets written by 300 writers. The second group with label of "xx", consists of character sets written by another 700 writers. The images with label "xx" are used as training set and the images with "hh" are used for testing. The images are scaled to size 70×70 pixels. The original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are both equal to $S_2(150)$. The AST-invariants descriptors: AST(3), AST(3)-W, AST-G, AST-L, AST-Z and AST-P are selected as feature extractors. The scale parameters for AST(3) are $\tilde{\Omega}_a = \tilde{\Omega}_b = 0.7$. AST(3)-W uses the same scale coefficients as AST(3), but the images' centroid are shifted to the origin by skew parameters $(w_x, w_y) = (-\frac{N_s-1}{2}, -\frac{N_s-1}{2})$. AST-G on the other hand, are made

compliant with proposed normalization conditions. We let the scale coefficient K'_2 be $0.187 \times N_s$ and translation coefficient $K'_1 = \frac{N_s-1}{2}$, which indicate the centroid of canonical forms of AST-G are now at the middle of transformed space $S_2(N_s)$.

For each AST invariant, moments up to order 10 are generated. This would make up a total of 66 feature vectors. The features generated from the training set are used by forward sequential search algorithm for dimensional reduction. Two sets of feature vectors each with 15 variables are selected by the search algorithm using the linear discriminant analysis (LDA), and quadratic discriminant analysis (QDA) as the classifiers, respectively. In the process of classification, LDA, QDA and support vector machine (SVM) are used as the classifiers. The three classifiers are used to ensure the objectiveness of the experiment in determining the discriminative power of proposed features. For classification using SVM, the radial basis function (RBF) kernel are deployed. A grid search on the penalty parameter C and kernel parameter γ using five-fold cross-validation has been executed to find the best parameter values (C, γ) , for range $C = 2^{-3}, 2^{-2}, \dots, 2^3$ and $\gamma = 2^{-5}, 2^{-2}, \dots, 2^1$.

Each pair of Chinese characters is evaluated separately. For each case, a total of 1400 Chinese handwritten characters from the two groups are used for feature selection and training, another 600 images are used for testing. The average misclassification rate (mcr) for all the pairs of characters are recorded. Figures 4.6 to 4.9 show the outcome of the experiments. Figure 4.6 indicates the classification performance of the LDA used in the process of dimension reduction, training and testing. Figure 4.7 shows the outcome of experiment with LDA used in the search algorithm, and SVM is used in training and testing. Figure 4.8 indicates the performance of the QDA algorithm in process of dimension reduction, training and testing. Finally Figure 4.9 shows the performance of using QDA in dimension reduction, and the SVM is used in training and testing. Unlike the previous experiment, AST-G in this case shows identical performance when compared to AST(3). The two features outperform other features by a margin ranging from 8% to 15%. The improvement on AST-G can be explained by the fact that AST-G is now using the similar normalization strategy as AST(3). The classification performance of AST-Z and AST-P are nearly identical, this indicates the strong correlation between the two algorithms. The performance of AST-L is relatively poor when compare with the others. This mainly due

to ambiguity caused by deviation of canonical images from the middle of space.

As shown in Figures 4.6 to 4.9, classification performance of the propose AST consistently outperform AST-L, AST-Z and AST-P in different type of classifiers. We therefore conclude that the discriminative power of proposed features is better with the new normalization schemes.

4.5 Conclusion

In this chapter the anisotropic scale and translation Tchebichef moment invariants using the method of image normalization has been reviewed. A new set of recurrence relations is proposed for fast computation on AST-invariants. Three new scale normalization schemes based on Tchebichef moments and the new spatial displacement normalization have been proposed to further improve the features discriminative power and classification performance. The performance of the proposed algorithm is supported by series of experiments conducted in this chapter.

CHAPTER 5

TRANSLATION, ROTATION AND SCALE TCHEBICHEF MOMENT INVARIANTS

In this chapter, translation, rotation, and scale (TRS) invariants for the discrete orthogonal moments are reviewed. The first TRS invariants of discrete orthogonal moments are proposed by Yap et al. (2007). In (Yap et al., 2007), the TRS Krawtchouk moment invariants are calculated indirectly using modified geometric moments. This is followed by translation and rotational Tchebichef moment invariants of H. Zhang et al. (2010) for Tchebichef moments using the image normalization approach. However the method is slow mainly due to the complexity of the hypergeometric functions involved. On the other hand, the algorithm proposed by Yap et al. (2007) is relatively faster. However the invariants are computed from the modified geometric moments. In the situation where the image is not present, this method is not usable. Thus a new set of TRS invariants have been proposed for discrete Tchebichef moments. The algorithms use new recursive formulae of the functions involved for fast computation. On top of that, a new set of normalization scheme based on Tchebichef moments has been proposed to improve the classification accuracy and to avoid the computational overhead caused by determining the parameters from other domains. An empirical study has confirmed that the proposed algorithms showed significant improvement in terms of numerical performance and classification accuracy.

5.1 Introduction

Translation, rotation and scale (TRS) is the spatial coordinate transformation defined by

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = a \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix}. \quad (5.1)$$

It is a four-parameter transformation, in which, a denotes the positive scaling factor, θ is the angle of rotation, a_3 and b_3 are the spatial displacements of image in the direction of x -axis and y -axis, respectively.

Invariants to translation, rotation and scale were first introduced by Hu (1962) for geometric moments (TRS-H). According to Hu, the translation invariance was achieved by shifting the image centroid to the origin using the central moments. The scale factor a was eliminated by the cancellation process using zero order moment. The rotation invariance was achieved by using the principal axis normalization. The $(n+m)^{\text{th}}$ -order of translation, rotation and scale geometric moment invariant, $I_{n,m}^{(\text{trs-H})}$, can be computed by

$$I_{n,m}^{(\text{trs-H})} = \frac{\left[\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} ((x - \bar{x}) \cos \theta_h + (y - \bar{y}) \sin \theta_h)^n \times (-(x - \bar{x}) \sin \theta_h + (y - \bar{y}) \cos \theta_h)^m f(x, y) dx dy \right]}{m_{0,0}^{\frac{n+m}{2} + 1}} \quad (5.2)$$

where

$$\bar{x} = \frac{m_{1,0}}{m_{0,0}}, \text{ and } \bar{y} = \frac{m_{0,1}}{m_{0,0}} \quad (5.3)$$

and $m_{p,q}$ denotes the geometric moment.

The angle θ_h is derived based on principal axis normalization given in Table 5.1 (Yap, 2006). The formula of θ_h is in fact equivalent to normalization of

$$\mu'_{2,0} \geq \mu'_{0,2} \quad (5.4)$$

where $\mu'_{n,m}$ is the central moment after the process of normalization.

The normalization however failed to resolve the ambiguity of object being rotated by 180° apart. Therefore additional normalization conditions is required as follows

$$\mu'_{3,0} \geq 0 \quad (5.5)$$

In Section 4.2, translation, rotation and scale Tchebichef moment invariants of Yap et. al. (2003) (TRS-Y) and translation and rotation Tchebichef moment invariants of Zhang et. al. (2010) (TR-Z), have been reviewed. In Section 4.3, a new set of TRS invariant algorithms is proposed for Tchebichef moments. Section 4.4 gives an empirical verification to support the theoretical frameworks. Section 4.5 concludes the topic.

5.2 Preliminaries for the Proposed Invariants

We first review some expressions that will be used in the latter sections.

Table 5.1: Values of θ_h

$\mu_{2,0} - \mu_{0,2}$	$\mu_{1,1}$	θ_h
0	0	0
0	+	$\pi/4$
0	-	$-\pi/4$
+	0	0
+	+	θ_b
+	-	$\theta_b + \pi$
-	0	$\pi/2$
-	+	$\theta_b + \pi/2$
-	-	$\theta_b + \pi/2$
$\theta_b = \frac{1}{2} \tan^{-1} \left(\frac{2\mu_{1,1}}{(\mu_{2,0} - \mu_{0,2})} \right)$		

Suppose $\tilde{t}_n^N(x)$ denotes the Tchebichef polynomial and $c_{n,k}^N$ are coefficients of the polynomials

$$t_n^N(x) = \sum_{k=0}^n c_{n,k}^N x^k \quad (5.6)$$

and $d_{k,n}^N$ denote the coefficients of Tchebichef polynomials such that

$$x^n = \sum_{j=0}^n d_{n,j}^N \tilde{t}_j^N(x), \quad x, n = 0, 1, \dots, N-1. \quad (5.7)$$

From the orthogonality property of Tchebichef polynomial $\tilde{t}_n^N(x)$, the coefficients $c_{n,k}^N$ and $d_{k,m}^N$ have the following relation

$$\sum_{k=m}^n c_{n,k}^N d_{k,m}^N = \delta_{n,m} \quad (5.8)$$

where $\delta_{n,m}$ denotes the Kronecker's delta that returns unity when $n = m$ and zero otherwise.

The three terms recurrence relation of Tchebichef polynomial, $\tilde{t}_n^N(x)$, can be expressed as

$$\begin{aligned} \tilde{t}_n^N(x) &= (x\tilde{A}_n^N + \tilde{B}_n^N)\tilde{t}_{n-1}^N(x) + \tilde{C}_n^N\tilde{t}_{n-2}^N(x), \\ n &= 2, 3, \dots, N-1 \end{aligned} \quad (5.9)$$

and

$$\tilde{t}_0^N(x) = \frac{1}{\sqrt{N}} \quad (5.10)$$

$$\tilde{t}_1^N(x) = (x\tilde{A}_1^N + \tilde{B}_1^N)\tilde{t}_0^N(x) \quad (5.11)$$

where

$$\tilde{A}_n^N = \frac{2}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (5.12)$$

$$\tilde{B}_n^N = \frac{(1-N)}{n} \sqrt{\frac{4n^2 - 1}{N^2 - n^2}} \quad (5.13)$$

$$\tilde{C}_n^N = -\frac{(n-1)}{n} \sqrt{\frac{2n+1}{2n-3}} \sqrt{\frac{N^2 - (n-1)^2}{N^2 - n^2}}. \quad (5.14)$$

5.2.1 Translation, Rotation and Scale Tchebichef Moment Invariants using Indirect Approach

In this section the invariance proposed by Yap et al. (2003) was implemented for the Tchebichef moments. The $(n+m)^{\text{th}}$ -order of TRS-Y $I_{n,m}^{(\text{trs-Y})}$, is expressed in the form of modified geometric moments

$$\begin{aligned} I_{n,m}^{(\text{trs-Y})} &= \frac{N^2}{2m_{0,0}} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N \left\{ [(x-\bar{x}) \cos(\theta_h) + (y-\bar{y}) \sin(\theta_h)] \sqrt{\frac{N^2}{2m_{0,0}} + \frac{N}{2}} \right\} \\ &\quad \times \tilde{t}_m^N \left\{ [-(x-\bar{x}) \sin(\theta_h) + (y-\bar{y}) \cos(\theta_h)] \sqrt{\frac{N^2}{2m_{0,0}} + \frac{N}{2}} \right\} \times f(x,y) \\ &= \sum_{k=0}^n \sum_{j=0}^m c_{n,k}^N c_{m,j}^N \dot{m}_{k,j} \end{aligned} \quad (5.15)$$

where

$$\begin{aligned} \dot{m}_{p,q} &= \frac{N^2}{2m_{0,0}} \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} f(x,y) \times \left\{ [(x-\bar{x}) \cos(\theta_h) + (y-\bar{y}) \sin(\theta_h)] \sqrt{\frac{N^2}{2m_{0,0}} + \frac{N}{2}} \right\}^p \\ &\quad \times \left\{ [-(x-\bar{x}) \sin(\theta_h) + (y-\bar{y}) \cos(\theta_h)] \sqrt{\frac{N^2}{2m_{0,0}} + \frac{N}{2}} \right\}^q \end{aligned} \quad (5.16)$$

and

$$\begin{aligned} \theta_h &= \frac{1}{2} \tan^{-1} \left(\frac{2\mu_{1,1}}{\mu_{2,0} - \mu_{0,2}} \right) \\ \bar{x} &= \frac{m_{1,0}}{m_{0,0}} \text{ and } \bar{y} = \frac{m_{0,1}}{m_{0,0}} \end{aligned} \quad (5.17)$$

$m_{p,q}$ denotes the geometric moment, and $\mu_{p,q}$ denotes the central moment.

The angle of θ_h is implemented following the values in Table 5.1, and the conditions (5.4) and (5.5) are used to resolve the ambiguities caused by principal axis normalization.

5.2.2 Translation and Rotation Tchebichef Moment Invariants of Zhang et. al.

TR-Z was initially proposed to provide rotational invariants for symmetric images (H. Zhang et al., 2010). It consists of the combination of two invariant algorithms, i.e. the translation invariants and rotation invariants to form the translation and rotational invariants.

5.2.2 (a) Translation Tchebichef Moment Invariants

Similar to Zhu et al. (2007c), the translation invariant is obtained via transforming the image's centroid to the origin using Tchebichef central moment

$$T_{n,m}^{(c)} = \sum_{x=0}^{N-1} \sum_{y=0}^{N-1} \tilde{t}_n^N(x - \bar{x}) \tilde{t}_m^N(y - \bar{y}) f(x, y) \quad (5.18)$$

where (\bar{x}, \bar{y}) denotes the image centroid coordinate given by

$$\bar{x} = \frac{c_{0,0}^N T_{1,0} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}}, \text{ and } \bar{y} = \frac{c_{0,0}^N T_{0,1} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}}. \quad (5.19)$$

By using (5.6), the translated Tchebichef polynomial $\tilde{t}_n^N(x - \bar{x})$ is decomposed into polynomials of x

$$\tilde{t}_n^N(x - \bar{x}) = \sum_{k=0}^n \sum_{r=0}^k \binom{k}{r} c_{n,k}^N x^r (-\bar{x})^{k-r}. \quad (5.20)$$

With the help of (5.7), we get

$$\tilde{t}_n^N(x - \bar{x}) = \sum_{k=0}^n \sum_{r=0}^k \sum_{u=0}^r \binom{k}{r} c_{n,k}^N d_{r,u}^N (-\bar{x})^{k-r} \tilde{t}_u^N(x). \quad (5.21)$$

Similarly for $\tilde{t}_m^N(y - \bar{y})$, we have

$$\tilde{t}_m^N(y - \bar{y}) = \sum_{j=0}^m \sum_{s=0}^j \sum_{v=0}^s \binom{j}{s} c_{m,j}^N d_{s,v}^N (-\bar{y})^{j-s} \tilde{t}_v^N(y). \quad (5.22)$$

By substituting (5.21) and (5.22) into (5.18), we get

$$T_{n,m}^{(c)} = \sum_{k=0}^n \sum_{j=0}^m \sum_{r=0}^k \sum_{u=0}^r \sum_{s=0}^j \sum_{v=0}^s \binom{k}{r} \binom{j}{s} c_{n,k}^N c_{m,j}^N d_{r,u}^N d_{s,v}^N \times (-\bar{x})^{k-r} (-\bar{y})^{j-s} T_{u,v}. \quad (5.23)$$

5.2.2 (b) Rotation Tchebichef Moment Invariants

As the derivation of the rotational invariant by H. Zhang et al.(2010) requires the image's centroid to be at the origin, the following invariants are therefore translation and rotational invariants. The moment invariants, $I_{n,m}^{(tr-Z)}$, are derived from the following expressions

$$I_{n,m}^{(tr-Z)} = \sum_{k=0}^n \sum_{j=0}^m \sum_{s=0}^k \sum_{t=0}^m \sum_{u=0}^{s+t} \sum_{v=0}^{k+j-s-t} \binom{k}{s} \binom{j}{t} (-1)^t \times (\cos \theta_z)^{j+s-t} (\sin \theta_z)^{k+t-s} c_{n,k}^N c_{m,j}^N d_{s+t,u}^N d_{j+k-s-t,v}^N T_{u,v}^{(c)} \quad (5.24)$$

where

$$\theta_z = \frac{1}{2} \tan^{-1} \left(\frac{pT_{1,1}^{(c)} - qT_{0,0}^{(c)}}{T_{2,0}^{(c)} - T_{0,2}^{(c)}} \right), \quad p = \frac{2c_{2,2}^N c_{0,0}^N}{(c_{1,1}^N)^2}, \quad q = \frac{2c_{2,2}^N (c_{1,0}^N)^2}{c_{0,0}^N (c_{1,1}^N)^2}. \quad (5.25)$$

According to our study, the derivation of TR-Z is indeed equivalent to normalization of

$$I_{1,1}^{(tr-Z)} = \left(\frac{c_{1,0}^N}{c_{0,0}^N} \right)^2 I_{0,0}^{(tr-Z)}. \quad (5.26)$$

The proof is given in Appendix C.

TR-Z has several weaknesses

(A1) Inability to resolve principal axis normalization ambiguities.

From our study, the rotation invariant algorithm has failed to resolved the ambiguities caused by principal axis normalization. This will be discussed in Section 5.4.

(A2) Slow in numerical computation

The formation of the invariant descriptor $I_{n,m}^{(tr-Z)}$ involved the decomposition of the transformed Tchebichef polynomials to polynomials in x and y , followed by consolidating the expressions of x and y back to the original Tchebichef polynomials (see (5.20) to (5.22)). As a result, the invariant formulae have long nested iterations which significantly slow down the numerical computation. On top of that the sequential computation of translation invariants followed by the rotational invariants further slowed down the speed of computation.

(A3) Lack of scale invariants.

The algorithms were unable to handle patterns having variation in size.

Comparatively, the algorithm of TRS-Y is simpler and faster. The complicated expressions are simplified by the modified geometric moments. However in the event where the image is not available, for example in image compression and only the selected orders of the Tchebichef moments are recorded, the indirect approach is not applicable. In addition, as shown by (5.15), the complexity of TRS-Y is proportional to the size of images. Thus the method is less efficient especially for large size images.

5.3 Proposed Translation, Rotation and Scale Tchebichef Moment Invariants

In this subsection the new TRS invariants are derived via image normalization. For convenience, TRS-invariants represent the new proposed TRS Tchebichef moment invariants with invariant descriptors denoted as $\{T_{n,m}^{(trs)}\}$.

5.3.1 Fast Computation using Recurrence Relations

Mathematically, TRS transformation is a special case of affine transformation. Therefore we introduce a recurrence relation for the affine Tchebichef moments (AM), so that it can later be used in derivation of the TRS transformed Tchebichef moments.

Suppose $f(x, y)$ is an image in the original space $S_2(N_0)$ and $g(x', y') = f(x, y)$ is the correspondent affine transformed images in the transformed space $S_2(N_s)$ such that

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} a_1 & a_2 \\ b_1 & b_2 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix} \quad (5.27)$$

where $S_2(N) = \{(x, y) \mid x, y = 0, 1, \dots, N-1\}$.

$S_2(N_0)$ and $S_2(N_s)$ are original and transformed spaces, respectively. The two spaces are independent so that the invariant descriptors can be directly computed from original images. This eliminate the need to re-mapped the original image into a prefixed space thus save numerous amount of computation resources in calculating the image moments.

Definition 5.3.1. The affine transformed Tchebichef moments $\{T_{n,m}^{(am)}\}$ are defined as

$$\begin{aligned} T_{n,m}^{(am)} &= |J| \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s}(a_1x + a_2y + a_3) \tilde{t}_m^{N_s}(b_1x + b_2y + b_3) f(x, y) \\ &\quad a_1, a_2, a_3, b_1, b_2, \text{ and } b_3 \in \mathfrak{R}, \\ &\quad n, m = 0, 1, \dots, \min(N_s - 1, N_0 - 1) \end{aligned} \quad (5.28)$$

where J denotes the Jacobian of the transformation satisfying

$$J = \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} \neq 0. \quad (5.29)$$

Theorem 5.3.1. *The affine transformed Tchebichef moment $T_{n,m}^{(\text{am})}$ is given by*

$$T_{n,m}^{(\text{am})} = |J| \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \lambda_{n,m,k,j} T_{k,j} \quad (5.30)$$

where $J = \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix}$, and the coefficients $\lambda_{n,m,k,j}$ have two recurrence relations respective to row and column. They are

$$\begin{aligned} \lambda_{n,m,k,j} \left(\begin{array}{c} a_1, a_2, a_3 \\ b_1, b_2, b_3 \end{array} \middle| N_0, N_s \right) = & -\lambda_{n-1,m,k+1,j} a_1 K_{n,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n-1,m,k,j+1} a_2 K_{n,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n-1,m,k,j} \tilde{A}_n^{N_s} \left[a_3 + \left(\frac{N_0-1}{2} \right) (a_1 + a_2) - \left(\frac{N_s-1}{2} \right) \right] \\ & + \lambda_{n-1,m,k-1,j} a_1 K_{n,k}^{N_s, N_0} + \lambda_{n-1,m,k,j-1} a_2 K_{n,j}^{N_s, N_0} \\ & + \lambda_{n-2,m,k,j} \tilde{C}_n^{N_s} \end{aligned} \quad (5.31)$$

and

$$\begin{aligned} \lambda_{n,m,k,j} \left(\begin{array}{c} a_1, a_2, a_3 \\ b_1, b_2, b_3 \end{array} \middle| N_0, N_s \right) = & -\lambda_{n,m-1,k+1,j} b_1 K_{m,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n,m-1,k,j+1} b_2 K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n,m-1,k,j} \tilde{A}_m^{N_s} \left[b_3 + \left(\frac{N_0-1}{2} \right) (b_1 + b_2) - \left(\frac{N_s-1}{2} \right) \right] \\ & + \lambda_{n,m-1,k-1,j} b_1 K_{m,k}^{N_s, N_0} + \lambda_{n,m-1,k,j-1} b_2 K_{m,j}^{N_s, N_0} \\ & + \lambda_{n,m-2,k,j} \tilde{C}_m^{N_s}. \end{aligned} \quad (5.32)$$

Proof. Suppose

$$x' = a_1 x + a_2 y + a_3 \quad (5.33)$$

$$y' = b_1 x + b_2 y + b_3 \quad (5.34)$$

where $a_1, a_2, a_3, b_1, b_2, b_3 \in \mathfrak{R}$, $(x, y) \in S_2(N_0)$ and $(x', y') \in S_2(N_s)$.

Consider

$$\tilde{t}_0^{N_s}(x') \tilde{t}_0^{N_s}(y') = \left(\frac{N_0}{N_s} \right) \tilde{t}_0^{N_0}(x) \tilde{t}_0^{N_0}(y), \quad (5.35)$$

we get

$$\lambda_{0,0,0,0} = \left(\frac{N_0}{N_s} \right). \quad (5.36)$$

For $\tilde{t}_1^{N_s}(x')\tilde{t}_0^{N_s}(y')$, we have

$$\begin{aligned} \tilde{t}_1^{N_s}(x')\tilde{t}_0^{N_s}(y') &= \left[(a_1x + a_2y + a_3)\tilde{A}_1^{N_s} + \tilde{B}_1^{N_s} \right] \tilde{t}_0^{N_s}(a_1x + a_2y + a_3) \\ &= a_1K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \left[x\tilde{A}_1^{N_0}\tilde{t}_0^{N_0}(x)\tilde{t}_0^{N_0}(y) \right] \\ &\quad + a_2K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \left[y\tilde{A}_1^{N_0}\tilde{t}_0^{N_0}(x)\tilde{t}_0^{N_0}(y) \right] \\ &\quad + K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \left[a_3\tilde{A}_1^{N_0} - \frac{(N_s-1)}{2}\tilde{A}_1^{N_0} \right] \tilde{t}_0^{N_0}(x)\tilde{t}_0^{N_0}(y) \\ &= \dots \\ &= a_1K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \tilde{t}_1^{N_0}(x)\tilde{t}_0^{N_0}(y) + a_2K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \tilde{t}_0^{N_0}(x)\tilde{t}_1^{N_0}(y) \\ &\quad + \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left[a_3 + \frac{(N_0-1)}{2}(a_1+a_2) - \frac{(N_s-1)}{2} \right] \\ &\quad \times \tilde{t}_0^{N_0}(x)\tilde{t}_0^{N_0}(y) \end{aligned} \quad (5.37)$$

which imply that

$$\lambda_{1,0,1,0} = a_1K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \quad (5.38)$$

$$\lambda_{1,0,0,1} = a_2K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \quad (5.39)$$

$$\lambda_{1,0,0,0} = \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left[a_3 + \frac{(N_0-1)}{2}(a_1+a_2) - \frac{(N_s-1)}{2} \right]. \quad (5.40)$$

Similarly, for $\tilde{t}_0^{N_s}(x')\tilde{t}_1^{N_s}(y')$

$$\begin{aligned} \tilde{t}_0^{N_s}(x')\tilde{t}_1^{N_s}(y') &= b_1K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \tilde{t}_1^{N_0}(x)\tilde{t}_0^{N_0}(y) + b_2K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \tilde{t}_0^{N_0}(x)\tilde{t}_1^{N_0}(y) \\ &\quad + \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left[b_3 + \frac{(N_0-1)}{2}(b_1+b_2) - \frac{(N_s-1)}{2} \right] \\ &\quad \times \tilde{t}_0^{N_0}(x)\tilde{t}_0^{N_0}(y). \end{aligned} \quad (5.41)$$

we get

$$\lambda_{0,1,1,0} = b_1K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \quad (5.42)$$

$$\lambda_{0,1,0,1} = b_2K_{1,1}^{N_s,N_0} \left(\frac{N_0}{N_s} \right) \quad (5.43)$$

$$\lambda_{0,1,0,0} = \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left[b_3 + \frac{(N_0-1)}{2}(b_1+b_2) - \frac{(N_s-1)}{2} \right]. \quad (5.44)$$

Suppose

$$\tilde{t}_p^{N_s}(a_1x + a_2y + a_3)\tilde{t}_q^{N_s}(b_1x + b_2y + b_3) = \sum_{k=0}^{p+q} \sum_{j=0}^{p+q-k} \lambda_{p,q,k,j} \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y) \quad (5.45)$$

is true for $p \leq n, q \leq m$.

We now consider $\tilde{t}_{n+1}^{N_s}(a_1x + a_2y + a_3)\tilde{t}_m^{N_s}(b_1x + b_2y + b_3)$.

From the three terms recurrence relation of the Tchebichef polynomials (5.9), we have

$$\begin{aligned} \tilde{t}_{n+1}^{N_s}(x') \tilde{t}_m^{N_s}(y') &= \left\{ (x' \tilde{A}_{n+1}^{N_s} + \tilde{B}_{n+1}^{N_s}) \tilde{t}_n^{N_s}(x') + \tilde{C}_{n+1}^{N_s} \tilde{t}_{n-1}^{N_s}(x') \right\} \tilde{t}_m^{N_s}(y') \\ &= \left\{ (a_1x + a_2y) \tilde{A}_{n+1}^{N_s} \right\} \tilde{t}_n^{N_s}(a_1x + a_2y + a_3) \tilde{t}_m^{N_s}(b_1x + b_2y + b_3) \\ &\quad + \left\{ a_3 \tilde{A}_{n+1}^{N_s} + \tilde{B}_{n+1}^{N_s} \right\} \tilde{t}_n^{N_s}(a_1x + a_2y + a_3) \tilde{t}_m^{N_s}(b_1x + b_2y + b_3) \\ &\quad + \tilde{C}_{n+1}^{N_s} \tilde{t}_{n-1}^{N_s}(a_1x + a_2y + a_3) \tilde{t}_m^{N_s}(b_1x + b_2y + b_3). \end{aligned} \quad (5.46)$$

By using the induction hypothesis (5.45), we get

$$\begin{aligned} \tilde{t}_{n+1}^{N_s}(x') \tilde{t}_m^{N_s}(y') &= \sum_{k=0}^{n+m+1} \sum_{j=0}^{n+m+1-k} \left\{ \lambda_{n,m,k-1,j} a_1 K_{n+1,k}^{N_s,N_0} - \lambda_{n,m,k,j} a_1 K_{n+1,k+1}^{N_s,N_0} \tilde{B}_{k+1}^{N_0} \right. \\ &\quad - \lambda_{n,m,k+1,j} a_1 K_{n+1,k+1}^{N_s,N_0} \tilde{C}_{k+2}^{N_0} + \lambda_{n,m,k,j-1} a_2 K_{n+1,j}^{N_s,N_0} \\ &\quad \left. - \lambda_{n,m,k,j} a_2 K_{n+1,j+1}^{N_s,N_0} \tilde{B}_{j+1}^{N_0} - \lambda_{n,m,k,j+1} a_2 K_{n+1,j+2}^{N_s,N_0} \tilde{C}_{k+2}^{N_0} \right\} \\ &\quad \times \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y) \\ &\quad + \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \left\{ \tilde{A}_{n+1}^{N_s} a_3 + \tilde{B}_{n+1}^{N_s} \right\} \lambda_{n,m,k,j} \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y) \\ &\quad + \sum_{k=0}^{n+m-1} \sum_{j=0}^{n+m-1-k} \tilde{C}_{n+1}^{N_s} \lambda_{n-1,m,k,j} \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y) \\ &= \dots \\ &= \sum_{k=0}^{n+m+1} \sum_{j=0}^{n+m+1-k} \left\{ -\lambda_{n,m,k+1,j} a_1 K_{n+1,k+2}^{N_s,N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n,m,k,j+1} a_2 K_{n+1,j+2}^{N_s,N_0} \tilde{C}_{j+2}^{N_0} \right. \\ &\quad + \lambda_{n,m,k,j} \tilde{A}_{n+1}^{N_s} \left[a_3 + \left(\frac{N_0-1}{2} \right) (a_1 + a_2) - \left(\frac{N_s-1}{2} \right) \right] \\ &\quad + \lambda_{n,m,k-1,j} a_1 K_{n+1,k}^{N_s,N_0} + \lambda_{n,m,k,j-1} a_2 K_{n+1,k}^{N_s,N_0} \\ &\quad \left. + \lambda_{n-1,m,k,j} \tilde{C}_{n+1}^{N_s} \right\} \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y). \end{aligned} \quad (5.47)$$

Similarly, by applying the same procedures, we obtain

$$\begin{aligned}
\tilde{t}_n^{N_s}(x') \tilde{t}_{m+1}^{N_s}(y') &= \sum_{k=0}^{n+m+1} \sum_{j=0}^{n+m+1-k} \left\{ -\lambda_{n,m,k+1,j} b_1 K_{m+1,k+2}^{N_s,N_0} \tilde{C}_{k+2}^{N_0} \right. \\
&\quad - \lambda_{n,m,k,j+1} b_2 K_{m+1,j+2}^{N_s,N_0} \tilde{C}_{j+2}^{N_0} \\
&\quad + \lambda_{n,m,k,j} \tilde{A}_{m+1}^{N_s} \left[b_3 + \left(\frac{N_0-1}{2} \right) (b_1 + b_2) - \left(\frac{N_s-1}{2} \right) \right] \\
&\quad + \lambda_{n,m,k-1,j} b_1 K_{m,k}^{N_s,N_0} + \lambda_{n,m,k,j-1} b_2 K_{m+1,j}^{N_s,N_0} \\
&\quad \left. + \lambda_{n,m-1,k,j} \tilde{C}_{m+1}^{N_s} \right\} \tilde{t}_k^{N_0}(x) \tilde{t}_j^{N_0}(y). \tag{5.48}
\end{aligned}$$

The theorem is now proved. \square

5.3.2 Normalization Schemes of Translation, Rotation and Scale Tchebichef Moment Invariants

In this section, we consider the normalization conditions that determine the parameter values for the proposed TRS invariants, and the uniqueness issues arising from the process of normalization.

Theorem 5.3.2. Suppose $I_{n,m}^{(\text{trs})}$ denote the proposed translation, rotation and scale Tchebichef moment invariants satisfying the following normalization conditions

$$I_{0,0}^{(\text{trs})} = \Omega_0 N_s \tag{5.49}$$

$$I_{1,0}^{(\text{trs})} = 0 = I_{0,1}^{(\text{trs})} \tag{5.50}$$

$$I_{1,1}^{(\text{trs})} = 0 \tag{5.51}$$

then

$$\begin{aligned}
I_{n,m}^{(\text{trs})} &= \omega^2 \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s} \left(\begin{array}{c} \omega \cos(\theta)(x - \bar{x}) \\ + \omega \sin(\theta)(y - \bar{y}) + \frac{N_s-1}{2} \end{array} \right) \times \\
&\quad \tilde{t}_m^{N_s} \left(\begin{array}{c} -\omega \sin(\theta)(x - \bar{x}) \\ + \omega \cos(\theta)(y - \bar{y}) + \frac{N_s-1}{2} \end{array} \right) f(x,y) \\
&\quad n, m = 0, 1, \dots, \min\{N_0-1, N_s-1\} \tag{5.52}
\end{aligned}$$

where

$$\omega = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} N_0}} \tag{5.53}$$

and

$$\theta = \frac{1}{2} \tan^{-1} \left\{ \frac{2 \left(\frac{N_0-1}{2} - \bar{x} \right) \left(\frac{N_0-1}{2} - \bar{y} \right) \tilde{A}_1^{N_0} T_{0,0} + 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{0,1} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{1,0} + \frac{2T_{1,1}}{\tilde{A}_1^{N_0}}}{\tilde{A}_1^{N_0} \left[\left(\frac{N_0-1}{2} - \bar{x} \right)^2 - \left(\frac{N_0-1}{2} - \bar{y} \right)^2 \right] T_{0,0} - 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{1,0} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{0,1} + \frac{T_{2,0}}{\tilde{A}_2^{N_0}} - \frac{T_{0,2}}{\tilde{A}_2^{N_0}}} \right\}. \quad (5.54)$$

Proof. Suppose $f'(x', y') = f(x, y)$ with

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \omega \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix}. \quad (5.55)$$

From (5.1), the transformed TRS has expression

$$\begin{aligned} I_{n,m}^{(\text{trs})} &= \omega^2 \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s} (\omega \cos(\theta)x + \omega \sin(\theta)y + a_3) \times \\ &\quad \tilde{t}_m^{N_s} (-\omega \sin(\theta)x + \omega \cos(\theta)y + b_3) f(x, y) \\ n, m &= 0, 1, \dots, \min\{N_0 - 1, N_s - 1\}. \end{aligned} \quad (5.56)$$

Consider the zero order moment, and the first normalization condition given by (5.49),

$$I_{0,0}^{(\text{trs})} = \omega^2 \frac{N_0}{N_s} T_{0,0} = \Omega_0 N_s, \quad (5.57)$$

we get

$$\omega = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} N_0}}. \quad (5.58)$$

From (5.55), we can deduce that

$$\bar{x}' = \bar{x} \omega \cos(\theta) + \bar{y} \omega \sin(\theta) + a_3 \quad (5.59)$$

$$\bar{y}' = -\bar{x} \omega \sin(\theta) + \bar{y} \omega \cos(\theta) + b_3 \quad (5.60)$$

where (\bar{x}, \bar{y}) and (\bar{x}', \bar{y}') denote the centroid for f and f' , respectively.

According to Theorem 4.3.3 the images with first order moments equal to zero will have centroid at middle of $S_2(N_s)$. Therefore we have

$$a_3 = -\bar{x} \omega \cos(\theta) - \bar{y} \omega \sin(\theta) + \frac{N_s - 1}{2}, \quad (5.61)$$

$$b_3 = \bar{x} \omega \sin(\theta) - \bar{y} \omega \cos(\theta) + \frac{N_s - 1}{2}. \quad (5.62)$$

By using (5.61) and (5.62), the expression (5.52) is proved.

We find the angle θ .

From Theorem 5.3.1 and the definition of $I_{n,m}^{(\text{trs})}$ given in (5.52), we have

$$I_{n,m}^{(\text{trs})} = \omega^2 \sum_{k=0}^{n+m} \sum_{j=0}^{m-k} \lambda_{n,m,k,j}^{(\text{trs})} T_{k,j} \quad (5.63)$$

where

$$\lambda_{n,m,k,j}^{(\text{trs})} = \lambda_{n,m,k,j} \begin{pmatrix} \omega \cos \theta, & \omega \sin \theta, \\ -\bar{x}\omega \cos \theta - \bar{y}\omega \sin \theta + \frac{N_s-1}{2}, \\ -\omega \sin \theta, & \omega \cos \theta, \\ \bar{x}\omega \sin \theta - \bar{y}\omega \cos \theta + \frac{N_s-1}{2} \end{pmatrix} \Bigg|_{N_0, N_s}. \quad (5.64)$$

By using (5.63), we can deduce that

$$\begin{aligned} I_{1,1}^{(\text{trs})} &= \sum_{k=0}^2 \sum_{j=0}^{2-k} \lambda_{1,1,k,j}^{(\text{trs})} T_{k,j} \quad (5.65) \\ &= \left\{ \frac{1}{2} \sin(2\theta) \left[-\left(\frac{N_0-1}{2} - \bar{x}\right)^2 + \left(\frac{N_0-1}{2} - \bar{y}\right)^2 \right] \right. \\ &\quad \left. + \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \left(\frac{N_0-1}{2} - \bar{y}\right) \right\} \times \omega^2 \left(\tilde{A}_1^{N_s}\right)^2 \left(\frac{N_0}{N_s}\right) T_{0,0} \\ &\quad + K_{1,1}^{N_s, N_0} \omega^2 \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s}\right) \left\{ \begin{array}{l} -\sin(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \\ + \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{y}\right) \end{array} \right\} T_{1,0} \\ &\quad + K_{1,1}^{N_s, N_0} \omega^2 \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s}\right) \left\{ \begin{array}{l} \sin(2\theta) \left(\frac{N_0-1}{2} - \bar{y}\right) \\ + \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \end{array} \right\} T_{0,1} \\ &\quad + \cos(2\theta) \left(K_{1,1}^{N_s, N_0}\right)^2 \omega^2 T_{1,1} - \frac{1}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \omega^2 \left(\frac{N_0}{N_s}\right) T_{2,0} \\ &\quad + \frac{1}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \omega^2 \left(\frac{N_0}{N_s}\right) T_{0,2}. \quad (5.66) \end{aligned}$$

The derivation of $I_{1,1}^{(\text{trs})}$ are shown in Appendix D.

By using the third normalization condition as stated in (5.51), we get (5.54). \square

The first normalization condition (5.49) eliminates the variation of the image size. The scale coefficient Ω_0 is defined so that the canonical forms are scaled proportional to transformed space $S_2(N_s)$. The second condition (5.50) achieves the translation invariants by shifting the images centroid to the middle of the transformed space. The third normalization condition (5.51) is for the rotation invariants using the principal axis normalization. However the solutions are not unique and require the additional constraints to resolve the ambiguities.

5.3.3 Uniqueness Issues of Translation, Rotational and Scaled Tchebichef Moment Invariants

In the principal axis normalization of geometric moments, there arises multiple ambiguities with each 90° apart respective to the image's centroid. For that, the constraints (5.4) and (5.5) are used in resolving the ambiguities. (5.4) rotates the image's principal axis so that it is parallel to the x -axis. This reduced the four ambiguities down to two with each 180° apart. By applying (5.5), the normalization will thus be unique.

In this chapter, despite the above mentioned method, we proposed an alternative way to deal with the ambiguities using the Tchebichef moments. For that, the following lemma is required.

Lemma 5.3.3. *Suppose g_1 and g_2 are two identical images with centroid at the middle of $S_2(N_s)$.*

1. *If g_1 and g_2 are separated by a 90° rotation about their image centroid then*

$$T_{2,0}(g_1) - T_{0,2}(g_1) = -[T_{2,0}(g_2) - T_{0,2}(g_2)]. \quad (5.67)$$

2. *If g_1 and g_2 are separated by a 180° rotation about their image centroid, then*

$$T_{3,0}(g_2) = -T_{3,0}(g_1). \quad (5.68)$$

Proof. From the given conditions, Tchebichef moments of g_2 are expressible as TRS transform on g_1 . We have

$$\begin{aligned} T_{2,0}(g_2) &= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_2^{N_s} \left(\begin{array}{c} \cos\left(\frac{\pi}{2}\right)x + \sin\left(\frac{\pi}{2}\right)y \\ -\cos\left(\frac{\pi}{2}\right)\bar{x} - \sin\left(\frac{\pi}{2}\right)\bar{y} + \frac{N_s-1}{2} \end{array} \right) \\ &\quad \times \tilde{t}_0^{N_s} \left(\begin{array}{c} -\sin\left(\frac{\pi}{2}\right)x + \cos\left(\frac{\pi}{2}\right)y \\ +\sin\left(\frac{\pi}{2}\right)\bar{x} - \cos\left(\frac{\pi}{2}\right)\bar{y} + \frac{N_s-1}{2} \end{array} \right) g_1(x, y) \\ &= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_2^{N_s}(y) \tilde{t}_0^{N_s}(N_s-1-x) g_1(x, y) \\ &= T_{0,2}(g_1). \end{aligned} \quad (5.69)$$

Similarly, for

$$\begin{aligned}
T_{0,2}(g_2) &= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_0^{N_s} \begin{pmatrix} \cos\left(\frac{\pi}{2}\right)x + \sin\left(\frac{\pi}{2}\right)y \\ -\cos\left(\frac{\pi}{2}\right)\bar{x} - \sin\left(\frac{\pi}{2}\right)\bar{y} + \frac{N_s-1}{2} \end{pmatrix} \\
&\quad \times \tilde{t}_2^{N_s} \begin{pmatrix} -\sin\left(\frac{\pi}{2}\right)x + \cos\left(\frac{\pi}{2}\right)y \\ +\sin\left(\frac{\pi}{2}\right)\bar{x} - \cos\left(\frac{\pi}{2}\right)\bar{y} + \frac{N_s-1}{2} \end{pmatrix} g_1(x, y) \\
&= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_0^{N_s}(y) \tilde{t}_2^{N_s}(N_s-1-x) g_1(x, y) \\
&= T_{2,0}(g_1).
\end{aligned} \tag{5.70}$$

Thus we have

$$T_{2,0}(g_2) - T_{0,2}(g_2) = -[T_{2,0}(g_1) - T_{0,2}(g_1)] \tag{5.71}$$

Now, we consider the condition of g_1 and g_2 which are 180° apart. We have

$$\begin{aligned}
T_{3,0}(g_2) &= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_3^{N_s} \begin{pmatrix} \cos(\pi)x + \sin(\pi)y \\ -\cos(\pi)\bar{x} - \sin(\pi)\bar{y} + \frac{N_s-1}{2} \end{pmatrix} \\
&\quad \times \tilde{t}_0^{N_s} \begin{pmatrix} -\sin(\pi)x + \cos(\pi)y \\ +\sin(\pi)\bar{x} - \cos(\pi)\bar{y} + \frac{N_s-1}{2} \end{pmatrix} g_1(x, y) \\
&= \sum_{x=0}^{N_s-1} \sum_{y=0}^{N_s-1} \tilde{t}_3^{N_s}(N_s-1-y) \tilde{t}_0^{N_s}(y) g_1(x, y) \\
&= -T_{3,0}(g_1)
\end{aligned} \tag{5.72}$$

□

Lemma 5.3.3 gives the theoretical basis of using the following constraints to resolve ambiguities caused by principal axis normalization on Tchebichef moments:

$$I_{2,0}^{(\text{trs})} \geq I_{0,2}^{(\text{trs})}, \text{ and} \tag{5.73}$$

$$I_{3,0}^{(\text{trs})} \geq 0. \tag{5.74}$$

With that, we are now ready to solve the uniqueness issues of the proposed TRS-invariants.

Theorem 5.3.4. Suppose g is the corresponding image of f distorted by translation, rotation and scale deformation, then

$$I_{n,m}^{\langle \text{trs} \rangle}(f) = I_{n,m}^{\langle \text{trs} \rangle}(g) \quad (5.75)$$

if the invariants $I_{n,m}^{\langle \text{trs} \rangle}(f)$ and $I_{n,m}^{\langle \text{trs} \rangle}(g)$ satisfy all the following normalization criteria

$$(B1) \quad I_{0,0}^{\langle \text{trs} \rangle}(\ast) = \Omega_0 N_s$$

$$(B2) \quad I_{1,0}^{\langle \text{trs} \rangle}(\ast) = 0 = I_{0,1}^{\langle \text{trs} \rangle}(\ast)$$

$$(B3) \quad I_{1,1}^{\langle \text{trs} \rangle}(\ast) = 0$$

$$(B4) \quad I_{2,0}^{\langle \text{trs} \rangle}(\ast) \geq I_{0,2}^{\langle \text{trs} \rangle}(\ast)$$

$$(B5) \quad I_{3,0}^{\langle \text{trs} \rangle}(\ast) \geq 0$$

Note: $\ast \in \{f, g\}$

Proof. Suppose g is TRS transformed to f such that $g(x_1, y_1) = f(x, y)$ and

$$\begin{pmatrix} x_1 \\ y_1 \end{pmatrix} = \omega_1 \begin{pmatrix} \cos \theta_1 & \sin \theta_1 \\ -\sin \theta_1 & \cos \theta_1 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix}. \quad (5.76)$$

Let f' and g' denote the TRS normalized images of f and g , respectively, so that

$$f'(x_f, y_f) = f(x, y) \quad \text{and} \quad g'(x_g, y_g) = g(x_1, y_1) \quad (5.77)$$

with

$$x_f = \omega_f \cos \theta_f (x - \bar{x}) + \omega_f \sin \theta_f (y - \bar{y}) + \frac{N_s - 1}{2} \quad (5.78)$$

$$y_f = -\omega_f \sin \theta_f (x - \bar{x}) + \omega_f \cos \theta_f (y - \bar{y}) + \frac{N_s - 1}{2} \quad (5.79)$$

and

$$x_g = \omega_g \cos \theta_g (x_1 - \bar{x}_1) + \omega_g \sin \theta_g (y_1 - \bar{y}_1) + \frac{N_s - 1}{2} \quad (5.80)$$

$$y_g = -\omega_g \sin \theta_g (x_1 - \bar{x}_1) + \omega_g \cos \theta_g (y_1 - \bar{y}_1) + \frac{N_s - 1}{2}. \quad (5.81)$$

In the above transformation, the centroid of f and g are mapped to the middle of the space following the second normalization condition.

By using (5.76), x_g and y_g can be expressed as functions of x and y . We get

$$\begin{aligned}
x_g &= \omega_g \omega_1 (x - \bar{x}) [\cos \theta_g \cos \theta_1 - \sin \theta_g \sin \theta_1] \\
&\quad + \omega_g \omega_1 (y - \bar{y}) [\cos \theta_g \sin \theta_1 + \sin \theta_g \cos \theta_1] + \frac{N_s - 1}{2} \\
&= \omega_g \omega_1 (x - \bar{x}) \cos(\theta_g + \theta_1) + \omega_g \omega_1 (y - \bar{y}) \sin(\theta_g + \theta_1) + \frac{N_s - 1}{2} \quad (5.82)
\end{aligned}$$

and

$$\begin{aligned}
y_g &= -\omega_g \omega_1 (x - \bar{x}) [\sin \theta_g \cos \theta_1 + \cos \theta_g \sin \theta_1] \\
&\quad + \omega_g \omega_1 (y - \bar{y}) [-\sin \theta_g \sin \theta_1 + \cos \theta_g \cos \theta_1] + \frac{N_s - 1}{2} \\
&= \omega_g \omega_1 (x - \bar{x}) \sin(\theta_g + \theta_1) + \omega_g \omega_1 (y - \bar{y}) \cos(\theta_g + \theta_1) + \frac{N_s - 1}{2}. \quad (5.83)
\end{aligned}$$

From (5.78) and (5.79) and Theorem 5.3.2, we have

$$\begin{aligned}
I_{n,m}^{\langle \text{trs} \rangle}(f) &= \omega_f^2 \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s} \left(\begin{array}{c} (x - \bar{x}) \omega_f \cos(\theta_f) \\ + (y - \bar{y}) \omega_f \sin(\theta_f) + \frac{N_s - 1}{2} \end{array} \right) \times \\
&\quad \tilde{t}_m^{N_s} \left(\begin{array}{c} -(x - \bar{x}) \omega_f \sin(\theta_f) \\ + (y - \bar{y}) \omega_f \cos(\theta_f) + \frac{N_s - 1}{2} \end{array} \right) f(x, y), \\
&\quad n, m = 0, 1, \dots, \min\{N_0 - 1, N_s - 1\} \quad (5.84)
\end{aligned}$$

where

$$\omega_f = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} N_0}} \quad (5.85)$$

and

$$\tan(2\theta_f) = \left\{ \frac{2 \left(\frac{N_0-1}{2} - \bar{x} \right) \left(\frac{N_0-1}{2} - \bar{y} \right) \tilde{A}_1^{N_0} T_{0,0} + 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{0,1} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{1,0} + \frac{2T_{1,1}}{\tilde{A}_1^{N_0}}}{\tilde{A}_1^{N_0} \left[\left(\frac{N_0-1}{2} - \bar{x} \right)^2 - \left(\frac{N_0-1}{2} - \bar{y} \right)^2 \right] T_{0,0} - 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{1,0} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{0,1} + \frac{T_{2,0}}{\tilde{A}_2^{N_0}} - \frac{T_{0,2}}{\tilde{A}_2^{N_0}}} \right\}. \quad (5.86)$$

Similarly for g , from (5.82 & 5.83), and Theorem 5.3.2, we have

$$\begin{aligned}
I_{n,m}^{(\text{trs})}(g) &= (\omega_g \omega_1)^2 \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} f(x,y) \\
&\quad \times \tilde{t}_n^{N_s} \left(\begin{array}{l} (x - \bar{x}) \omega_g \omega_1 \cos(\theta_g + \theta_1) \\ + (y - \bar{y}) \omega_g \omega_1 \sin(\theta_g + \theta_1) + \frac{N_s-1}{2} \end{array} \right) \\
&\quad \times \tilde{t}_m^{N_s} \left(\begin{array}{l} -(x - \bar{x}) \omega_g \omega_1 \sin(\theta_g + \theta_1) \\ + (y - \bar{y}) \omega_g \omega_1 \cos(\theta_g + \theta_1) + \frac{N_s-1}{2} \end{array} \right), \\
n, m &= 0, 1, \dots, \min\{N_0 - 1, N_s - 1\}
\end{aligned} \tag{5.87}$$

where

$$\omega_g \omega_1 = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} N_0}} \tag{5.88}$$

and

$$\tan(2(\theta_g + \theta_1)) = \left\{ \frac{2 \left(\frac{N_0-1}{2} - \bar{x} \right) \left(\frac{N_0-1}{2} - \bar{y} \right) \tilde{A}_1^{N_0} T_{0,0} + 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{0,1} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{1,0} + \frac{2T_{1,1}}{\tilde{A}_1^{N_0}}}{\tilde{A}_1^{N_0} \left[\left(\frac{N_0-1}{2} - \bar{x} \right)^2 - \left(\frac{N_0-1}{2} - \bar{y} \right)^2 \right] T_{0,0} - 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{1,0} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{0,1} + \frac{T_{2,0}}{\tilde{A}_2^{N_0}} - \frac{T_{0,2}}{\tilde{A}_2^{N_0}}} \right\}. \tag{5.89}$$

From (5.85) and (5.88), we get

$$\omega_g \omega_1 = \pm \omega_f. \tag{5.90}$$

The negative sign of (5.90) can be treated as change of phase by angle of π , which can later be resolved together using the forth and fifth normalization criteria. Without loss of generality, we may therefore let

$$\omega_g \omega_1 = \omega_f. \tag{5.91}$$

From (5.86) and (5.89), we have

$$\tan(2\theta_f) = \tan[2(\theta_g + \theta_1)] \tag{5.92}$$

that will give us solutions

$$\begin{aligned}
\theta_f - \theta_g &= \theta_1 + n\pi \\
n &= 0, \pm 1, \dots
\end{aligned} \tag{5.93}$$

By using the forth and fifth conditions on normalization criteria, the ambiguities are resolved. Thus we get

$$\theta_f - \theta_g = \theta_1. \quad (5.94)$$

By substituting (5.91) and (5.94) into (5.87), we therefore have

$$I_{n,m}^{(\text{trs})}(g) = I_{n,m}^{(\text{trs})}(f).$$

□

It is important to note that the solution fails if both $I_{1,1}^{(\text{trs})}(f) = 0$ and $I_{2,0}^{(\text{trs})}(f) - I_{0,2}^{(\text{trs})}(f) = 0$. To resolve the issue, higher order TRS moments are needed to determine the rotation angle. This will be discussed in Chapter 6.

5.3.4 Skewed Translation, Rotation and Scaled Tchebichef Moment Invariants

Similar to previous chapters, skewed parameters for TRS are introduced to enhance the discriminative power of the moment invariants.

$$I_{n,m}^{(\text{trs})} = \omega^2 \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \lambda_{n,m,k,j}^{(\text{trs})} T_{k,j} \quad (5.95)$$

where

$$\lambda_{n,m,k,j}^{(\text{trs})} = \lambda_{n,m,k,j} \left(\begin{array}{c} \omega \cos \theta, \quad \omega \sin \theta, \\ -\omega \bar{x} \cos \theta - \omega \bar{y} \sin \theta + \frac{N_s-1}{2} + w_x; \\ -\omega \sin \theta, \quad \omega \cos \theta, \\ \omega \bar{x} \sin \theta - \omega \bar{y} \cos \theta + \frac{N_s-1}{2} + w_y \end{array} \middle| N_0, N_s \right). \quad (5.96)$$

Here skew parameters (w_x, w_y) are denoted as the spatial displacements transformation in units of pixel from the middle of space.

5.4 Experimental Results

In this section, experimental results of the TRS algorithms are provided. The first experiment evaluates the accuracy of the rotation invariants of the proposed algorithm. In the second experiment, the accuracy of the proposed translation, rotation and scale invariants algorithm is reviewed. The third experiment valuates the computational performance of TRS algorithms. Finally, the classification performance of the proposed algorithm is evaluated in non-noisy and noisy environments.

5.4.1 Accuracy on Rotation Invariants

In this subsection, we evaluate the accuracy of the rotation invariant algorithms. For this experiment, the original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are both equal to $S_2(120)$. A set of binary images with size 60×60 in original space, are used in this experiment. The images shown in Figure 5.1 are rotated by angles $\theta : 0^\circ, 5^\circ, 10^\circ, \dots, 355^\circ$. The relative standard deviations of the percentage spread $RSD(\%)$, are used in the experiment to measure the accuracy of TRS algorithms. The selected feature values for proposed TRS, TR-Z and TRS-Y are recorded in Tables 5.2, 5.3 and 5.4, respectively. As shown in the tables, the three features exhibit good accuracy for rotational invariants. Comparatively, TR-Z is found to be better in terms of the accuracy. However when we analyze the normalized images, ambiguities have been detected for TR-Z. A pair of normalized images for each pattern of “7” and “shen” and their feature values are shown in Tables 5.5 and 5.6 for TR-Z and TRS, respectively. In Table 5.6 where the proposed TRS algorithms are used as rotation descriptor. No ambiguity has been detected and the features were accurately computed. In Table 5.5, for display purpose, the output of canonical images of TR-Z are translated from the origin to middle of transformed space $S_2(N_s)$. The output of the canonical forms is found to be separated by an angle of 180° rotation relative to images’ centroid. The feature values of TR-Z however are found to be nearly identical despite the ambiguities. This can be due to the “skew” effect of images from the middle of transformed space. As a result, the translation and rotation invariants of Zhang et. al. can be considered as accurate numerically. However from the perspective of classification, the TR-Z algorithm has failed to discriminate the two very distinctive forms implies that the features set has poor within classes separation. Therefore TR-Z invariants could be poor in classification performance. The statement has been confirmed by experiments.

5.4.2 Experiment on Accuracy of Translation, Rotation, and Scale Invariants

In this subsection the computational accuracy of the proposed algorithms has been reviewed. A set of images of different complexities representing groups of numbers, letters, Chinese characters and symbols are used in this experiment. Here the original space $S_2(N_0)$ and the transformed space $S_2(N_s)$ are both equal to $S_2(200)$. In Table 5.7, images with size 90×90 pixels, are scaled uniformly by factors of $\{0.5, 0.6, \dots, 1.5\}$, rotated by angles between 0° to 359° and translated by $\{-5, 0, 5\}$ from the centre. The selected output of TRS invariants are listed in Tables 5.8 and 5.9 for proposed TRS-invariants and TRS-Y, respectively. TR-Z was not evaluated as the features did not have the scale invariants. As shown in the tables, the performance of proposed TRS and TRS-Y are nearly identical. This is mainly due to both algorithms are using nearly similar normalization strategy. The methods are accurate for the even order invariants or invariants with relatively large values. The odd order invariants and the invariants with relatively small values are less accurate. This is mainly due to the cancellation process of the invariant transformation functions which is vulnerable to discretization errors. The problems can be easily overcome by incorporating suitable skew parameter values.

5.4.3 Numerical Computational Efficiency

In this subsection, the computational efficiency of the proposed algorithms has been evaluated. The program was implemented in Matlab 2011b, on Intel i3 550 processor with 3.2GHz, 3GB of RAM. In this experiment, images with size 50×50 , 100×100 , 150×150 , and 200×200 pixels were used to generate invariants with orders of 10, 20, and 30. The experiment was repeated 200 times and the average CPU elapse times in millisecond are recorded. From Table 5.10, on average (excluding the moment generation time), the proposed method is about 1,930 times faster than TR-Z. This shows significant amount of overhead due to the expression in the TR-Z algorithm and the effectiveness of recurrence relations in simplifying the numerical computations. In terms of total computation time, the proposed method is superior when compared with TR-Z and TRS-Y. On average the propose method is 5.2 times faster than TRS-Y.

Table 5.10: Comparison of CPU elapse time (ms) for translation, rotational and scale descriptors

Image Size	Order of descriptors	TRS-Y (ms)	Proposed TRS			TR-Z	
			Moments generation times (ms)	Invariant generation times (ms)	Total time (ms)	Invariant generation times (ms)	Total time (ms)
(50 × 50)	10	54.121	10.308	1.607	11.915	60.007	70.315

5.4.4 Experiment on Object Classification

In this experiment, the classification performance of the proposed TRS have been tested. For the purpose of comparison, TRS-Y, TR-Z are included. The following feature vectors are used to classify the images

$$\mathbf{V} = [I_{2,0}, I_{0,2}, I_{3,0}, I_{1,2}, I_{2,1}, I_{0,3}]^T \quad (5.97)$$

where $I_{n,m}$ denote the TRS-invariants defined in previous section. In this experiment, Euclidean distance is utilized as the classification measure. The formula given below is similar to (2.73).

$$d(\tilde{\mathbf{V}}_s, \tilde{\mathbf{V}}_t^{(k)}) = \sum_{j=1}^J (\tilde{v}_{s,j} - \tilde{v}_{t,j}^{(k)})^2 \quad (5.98)$$

where $\tilde{\mathbf{V}}_s$ is the J -dimensional scaled feature vector of unknown sample, and $\tilde{\mathbf{V}}_t^{(k)}$ is the scaled training vector of class k .

The recognition accuracy, η , is defined as follows

$$\eta = \frac{\text{Number of correctly classified images}}{\text{Total number of images used in the test}}. \quad (5.99)$$

A set of Chinese characters as listed in Figure 5.2 are used as training set. The size of each training image is 100×100 pixels. The original space $S_2(N_0)$ and transformed space $S_2(N_s)$ are equal to $S_2(150)$. The testing set is generated by rotating with angles of $\theta \in \{0^\circ, 20^\circ, \dots, 340^\circ\}$ and translation t_x and $t_y \in \{-5, 0, 5\}$. Due to TR-Z being not scale invariant, scale deformations are not applicable to the test images. Excluding those similar to the original images, the transformation forms a testing set of 12,940 images. This is followed by adding salt-and-pepper noise with different noise densities. Figure 5.3 shows some of the testing images contaminated by 4% of salt-and-pepper noise.

Figure 5.2: Binary images as training set for experiment on character recognition.

The classification performance of the proposed TRS is compared with the other TRS-invariants algorithms shown in Table ?? . As shown in the table, the proposed TRS has identical performance when compared with TRS-Y. This is mainly due to both algorithms using the identical normalization strategy. On the other hand, TR-Z is lowest in the classification performance. This is mainly caused by the skew effect that compromised the within class separation. As such, adding of noise will wipe out the slim separation between those classes. Therefore TR-Z is found to be extremely sensitive to noise. The argument is supported by the poor performance shown by TRS-W where the centroid of the image has been shifted to the origin.

Classification result of images with translation and rotation transformation

Salt & pepper	Accuracy (%)			
	TRS	TRS-W*	TRS-Y	TR-Z
No noise	100	100	100	100
0.01	95.750	76.121	95.696	31.221
0.02	89.845	41.213	89.737	19.985
0.03	78.601	26.275	78.408	14.830
0.04	67.473	20.363	67.403	5.587

TRS-W* denotes TRS with centroid at the origin.

5.5 Conclusion

In this chapter, the translation, rotation and scale Tchebichef moment invariants of Yap et al.(2003) and translation rotation Tchebichef moment invariants of H. Zhang et al. (2011) have been reviewed. Both methods are slow in the computational speed. In addition, the classification performance of TR-Z is highly sensitive to noise. Thus a new TRS invariants has been proposed to resolve the above mentioned issues. A new set of recurrence relations has been derived for the fast computation of affine Tchebichef moments which can then be applied to derive the TRS invariant descriptors. A new set of normalization scheme using Tchebichef moments have been defined so that the computation overhead caused by determination of the normalization parameters from other domain can be avoided. Empirical studies showed significant improvement in numerical performance with the proposed algorithm. The features of proposed invariants are also found to have equivalent or better classification performance when compared with existing TRS invariants.

CHAPTER 6

AFFINE TCHEBICHEF MOMENT INVARIANTS USING IMAGE NORMALIZATION

In this chapter a new affine Tchebichef moment invariants has been proposed. The invariants consists of recurrence relations for fast computation, and a new set of normalization schemes based on Tchebichef moments. An experiment has been carried out to verify the correctness of the proposed algorithms.

6.1 Introduction

Affine transformation is a general linear transformation of spatial coordinates which can be defined as

$$\begin{pmatrix} x' \\ y' \end{pmatrix} = \begin{pmatrix} a_1 & a_2 \\ b_1 & b_2 \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} + \begin{pmatrix} a_3 \\ b_3 \end{pmatrix}$$

$$(x, y) \in S_2(N_0), \text{ and } (x', y') \in S_2(N_s). \quad (6.1)$$

The affine transformed Tchebichef moments $T_{n,m}^{(am)}$ are defined as

$$T_{n,m}^{(am)} = |J| \sum_{x=0}^{N_0-1} \sum_{y=0}^{N_0-1} \tilde{t}_n^{N_s}(a_1x + a_2y + a_3) \tilde{t}_m^{N_s}(b_1x + b_2y + b_3) f(x, y)$$

$$a_1, a_2, a_3, b_1, b_2, \text{ and } b_3 \in \mathfrak{R},$$

$$n, m = 0, 1, \dots, \min\{N_s - 1, N_0 - 1\} \quad (6.2)$$

where Jacobian of the transformation J satisfies

$$J = \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} \neq 0. \quad (6.3)$$

Image normalization to affine transformation is based on proper decomposition of an affine transformation into several simpler transformations. Several decomposition schemes have been proposed. Pei and Lin (1995) proposed a decomposition of two rotations and a nonuniform scaling between them. Their method used eigenvalues of the covariance matrix and tensors for computation of normalization coefficients. However

the method failed to work on symmetric objects. Shen and Ip (1997) derived the invariants using generalized complex moments and Fourier transformation in polar coordinates. The method worked for symmetric objects but is exceedingly complicated. Rothe, Susse, and Voss (1996) proposed two different decomposition schemes known as XSR, (the decomposition to skew, nonuniform scaling and rotation), and XYS (the decomposition to two skews and a nonuniform scaling). However the approaches lead to some ambiguities, which were later studied in detail by Y. Zhang, Wen, Zhang, and Soh (2003). For discrete domain, affine Tchebichef moments has been proposed by Liu et al. (2011) based on the decomposition of XSR and XYS by Rothe et al. (1996). However the invariant algorithms are numerically inefficient mainly due to complexity of hypergeometric moments involved. Furthermore, as pointed out in Chapter 5, some ambiguities have been detected for the rotation algorithm used by Liu et al. (2011) in XSR. Therefore we propose an alternative approach that follow the decomposition technique by Flusser et al. (2009). The method is selected mainly due to its ability to accurately discriminate both non-symmetric and symmetric patterns. In Section 6.2, the proposed affine Tchebichef moment invariants has been derived. This is followed by an experiment to verify the accuracy of the proposed method in Section 6.3. Section 6.4 concludes this topic.

6.2 Proposed Affine Tchebichef Moment Invariants

6.2.1 Fast Computation of Affine Tchebichef Moment Invariants

Fast computation algorithms has been derived in Chapter 5 by using Theorem 5.3.1. We list it here for the purpose of completeness.

The $(n + m)^{\text{th}}$ —order of affine transformed Tchebichef moment $T_{n,m}^{(\text{am})}$ has expression

$$T_{n,m}^{(\text{am})} = |J| \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \lambda_{n,m,k,j} T_{k,j} \quad (6.4)$$

where $J = \begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix}$, and the coefficients $\lambda_{n,m,k,j}$, have recurrence relations

$$\begin{aligned} \lambda_{n,m,k,j} \left(\begin{array}{c} a_1, a_2, a_3 \\ b_1, b_2, b_3 \end{array} \middle| N_0, N_s \right) = & -\lambda_{n-1,m,k+1,j} a_1 K_{n,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n-1,m,k,j+1} a_2 K_{n,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n-1,m,k,j} \tilde{A}_n^{N_s} \left[a_3 + \left(\frac{N_0 - 1}{2} \right) (a_1 + a_2) - \left(\frac{N_s - 1}{2} \right) \right] \\ & + \lambda_{n-1,m,k-1,j} a_1 K_{n,k}^{N_s, N_0} + \lambda_{n-1,m,k,j-1} a_2 K_{n,j}^{N_s, N_0} \\ & + \lambda_{n-2,m,k,j} \tilde{C}_n^{N_s} \end{aligned} \quad (6.5)$$

and

$$\begin{aligned} \lambda_{n,m,k,j} \left(\begin{array}{c} a_1, a_2, a_3 \\ b_1, b_2, b_3 \end{array} \middle| N_0, N_s \right) = & -\lambda_{n,m-1,k+1,j} b_1 K_{m,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n,m-1,k,j+1} b_2 K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n,m-1,k,j} \tilde{A}_m^{N_s} \left[b_3 + \left(\frac{N_0 - 1}{2} \right) (b_1 + b_2) - \left(\frac{N_s - 1}{2} \right) \right] \\ & + \lambda_{n,m-1,k-1,j} b_1 K_{m,k}^{N_s, N_0} + \lambda_{n,m-1,k,j-1} b_2 K_{m,j}^{N_s, N_0} \\ & + \lambda_{n,m-2,k,j} \tilde{C}_m^{N_s}. \end{aligned} \quad (6.6)$$

6.2.2 Normalization Scheme for Affine Tchebichef Moment Invariants

Suppose $f(x, y)$ denotes the original image in space $S_2(N_0)$ and $f'(x', y')$ denotes the corresponding affine transformed image in space $S_2(N_s)$. According to Flusser et al. (2009), the affine normalization with the 7 decompositions, each with a single transformation variable, is given as follows:

(A1) Horizontal translation:

$$x' = x + \alpha \quad (6.7)$$

$$y' = y. \quad (6.8)$$

(A2) Vertical translation:

$$x' = x \quad (6.9)$$

$$y' = y + \beta. \quad (6.10)$$

(A3) Uniform scaling:

$$x' = \omega x \quad (6.11)$$

$$y' = \omega y. \quad (6.12)$$

(A4) First Rotation

$$x' = x \cos \theta_1 + y \sin \theta_1 \quad (6.13)$$

$$y' = -x \sin \theta_1 + y \cos \theta_1. \quad (6.14)$$

(A5) Stretching:

$$x' = \delta x \quad (6.15)$$

$$y' = \frac{1}{\delta} y. \quad (6.16)$$

(A6) Second rotation

$$x' = x \cos \theta_2 + y \sin \theta_2 \quad (6.17)$$

$$y' = -x \sin \theta_2 + y \cos \theta_2. \quad (6.18)$$

(A7) Mirror reflection

$$x' = x \quad (6.19)$$

$$y' = \pm y. \quad (6.20)$$

As shown in Chapters 3 to 5, a new set of normalization schemes is required for the above transformations, so that, better classification performance can be assured, and the numerical computation overhead caused by determining parameters from other domain can be avoided.

6.2.3 Translation, Rotation and Scale Invariants

As the first four transformations are the decomposition of translation, rotation and scale (TRS) transformation we may combine them into a single TRS transform following the normalization scheme proposed by Theorem 5.3.2:

$$x' = \omega \cos \theta_1 (x - \bar{x}) + \omega \sin \theta_1 (y - \bar{y}) + \frac{N_s - 1}{2} \quad (6.21)$$

$$y' = -\omega \sin \theta_1 (x - \bar{x}) + \omega \cos \theta_1 (y - \bar{y}) + \frac{N_s - 1}{2}. \quad (6.22)$$

In this case the transformed image's centroid is at the middle of $S_2(N_s)$. The scale coefficient ω is determined so that the canonical image is proportionally to the transformed space $S_2(N_s)$.

$$\omega = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} \times N_0}} \quad (6.23)$$

where Ω_0 denotes the scale coefficients.

The first rotation angle θ_1 is

$$\theta_1 = \frac{1}{2} \tan^{-1} \left\{ \frac{2 \left(\frac{N_0-1}{2} - \bar{x} \right) \left(\frac{N_0-1}{2} - \bar{y} \right) \tilde{A}_1^{N_0} T_{0,0} + 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{0,1} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{1,0} + \frac{2T_{1,1}}{\tilde{A}_1^{N_0}}}{\tilde{A}_1^{N_0} \left[\left(\frac{N_0-1}{2} - \bar{x} \right)^2 - \left(\frac{N_0-1}{2} - \bar{y} \right)^2 \right] T_{0,0} - 2 \left(\frac{N_0-1}{2} - \bar{x} \right) T_{1,0} + 2 \left(\frac{N_0-1}{2} - \bar{y} \right) T_{0,1} + \frac{T_{2,0}}{\tilde{A}_2^{N_0}} - \frac{T_{0,2}}{\tilde{A}_2^{N_0}}} \right\}. \quad (6.24)$$

Ambiguities of principal axis normalization are then resolved by Theorem 5.3.4 with constraints

$$I_{2,0}^{(\text{trs})} \geq I_{0,2}^{(\text{trs})}, \text{ and} \quad (6.25)$$

$$I_{3,0}^{(\text{trs})} \geq 0. \quad (6.26)$$

6.2.4 Normalization on Stretching

The stretch normalization of (6.15) and (6.16) is proposed to eliminate the non-reflective anisotropic scale deformation. It is given by the following theorem.

Theorem 6.2.1. *Suppose $I_{n,m}^{(trs)}$ denotes the TRS Tchebichef moment invariant, then a non-reflective anisotropic scaled deformation can be resolved by stretch normalization with constraint*

$$I_{2,0}^{(s, trs)} = I_{0,2}^{(s, trs)} \quad (6.27)$$

and stretch coefficient

$$\delta = \left(\frac{I_{0,2}^{(trs)} - \tilde{C}_2^{N_s} I_{0,0}^{(trs)}}{I_{2,0}^{(trs)} - \tilde{C}_2^{N_s} I_{0,0}^{(trs)}} \right)^{\frac{1}{4}} \quad (6.28)$$

where $I_{n,m}^{(s, trs)}$ denotes the Tchebichef moment after the normalizations of TRS transformation and stretch transformation.

Proof. From Theorem 5.3.1, we get

$$I_{2,0}^{(s, trs)} = \delta^2 I_{2,0}^{(s, trs)} + \tilde{C}_2^{N_s} (1 - \delta^2) I_{0,0}^{(s, trs)} \quad \text{and} \quad (6.29)$$

$$I_{0,2}^{(s, trs)} = \left(\frac{1}{\delta^2} \right) I_{0,2}^{(s, trs)} + \tilde{C}_2^{N_s} \left[1 - \left(\frac{1}{\delta^2} \right) \right] I_{0,0}^{(s, trs)}. \quad (6.30)$$

The derivation of $I_{2,0}^{(s, trs)}$ and $I_{0,2}^{(s, trs)}$ are given by Appendix E.

By using the constraint $I_{2,0}^{(s, trs)} = I_{0,2}^{(s, trs)}$ we can show that

$$\delta = \left(\frac{I_{0,2}^{(s, trs)} - \tilde{C}_2^{N_s} I_{0,0}^{(s, trs)}}{I_{2,0}^{(s, trs)} - \tilde{C}_2^{N_s} I_{0,0}^{(s, trs)}} \right)^{\frac{1}{4}}. \quad (6.31)$$

□

6.2.5 Normalization on Second Rotation

After the process of TRS and stretch normalizations, Tchebichef moments of order two and below are no longer usable. This is mainly due to the dependency in the process of normalization. For example, it is found that $I_{0,0}^{(s, trs)} = \Omega_0 N_s$, $I_{1,0}^{(s, trs)} = I_{0,1}^{(s, trs)} = I_{1,1}^{(s, trs)} = 0$, and $I_{2,0}^{(s, trs)} = I_{0,2}^{(s, trs)}$. Thus higher order Tchebichef moments are required to determine the second rotation. It is also important to note that, with all the prescribed normalization, non-symmetric image might end up to be symmetric. Hence the capability of second rotational algorithm to deal with symmetric image is curtailed for the accuracy of

AMI. For the second rotation, the normalization scheme proposed by Abu-Mostafa and Psaltis (1985) which is based on complex moments is usually used. This can also be accomplished based on Tchebichef moments. The theorem is given as follows

Theorem 6.2.2. Suppose $I_{n,m}^{(s, \text{trs})}$ are the Tchebichef moments after TRS and stretch normalizations, and $R_2(\theta_2)$ denotes the second rotation normalization about the centre of transformed space with angle θ_2 . The second rotation on the normalized moment, $I_{n,m}^{(r_2, s, \text{trs})}$, is rotational invariant if it satisfies one of the following normalization criteria

(B1) Second rotation normalization for non-symmetric, 1-fold symmetric images,

$$\theta_2 = \tan^{-1} \left[\frac{I_{2,1}^{(s, \text{trs})} + K_{1,3}^{N_s, N_s} I_{0,3}^{(s, \text{trs})}}{I_{1,2}^{(s, \text{trs})} + K_{1,3}^{N_s, N_s} I_{3,0}^{(s, \text{trs})}} \right] \quad (6.32)$$

and

$$I_{1,2}^{(r_2, s, \text{trs})} + K_{1,3}^{N_s, N_s} I_{3,0}^{(r_2, s, \text{trs})} > 0. \quad (6.33)$$

(B2) Second rotation normalization for 2-fold symmetric images,

$$\theta_2 = \frac{1}{2} \tan^{-1} \frac{I_{3,1}^{(s, \text{trs})} + I_{1,3}^{(s, \text{trs})}}{\left\{ \begin{aligned} &\frac{1}{2} \left[K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \\ &\times (I_{0,2}^{(s, \text{trs})} - I_{2,0}^{(s, \text{trs})}) - \frac{1}{2} K_{1,4}^{N_s, N_s} (I_{0,4}^{(s, \text{trs})} - I_{4,0}^{(s, \text{trs})}) \end{aligned} \right\}} \quad (6.34)$$

and

$$\begin{aligned} &\frac{1}{2} \left[K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \times (I_{0,2}^{(r_2, s, \text{trs})} - I_{2,0}^{(r_2, s, \text{trs})}) \\ &- \frac{1}{2} K_{1,4}^{N_s, N_s} (I_{0,4}^{(r_2, s, \text{trs})} - I_{4,0}^{(r_2, s, \text{trs})}) > 0. \end{aligned} \quad (6.35)$$

(B3) Second rotation normalization for 3-fold symmetric images,

$$\theta_2 = \frac{1}{3} \tan^{-1} \left\{ \frac{\tilde{A}_1^{N_s} I_{0,3}^{(s, \text{trs})} - 3\tilde{A}_3^{N_s} I_{2,1}^{(s, \text{trs})}}{3\tilde{A}_3^{N_s} I_{1,2}^{(s, \text{trs})} - \tilde{A}_1^{N_s} I_{3,0}^{(s, \text{trs})}} \right\} \quad (6.36)$$

and

$$3\tilde{A}_3^{N_s} I_{1,2}^{(r_2, s, \text{trs})} - \tilde{A}_1^{N_s} I_{3,0}^{(r_2, s, \text{trs})} > 0. \quad (6.37)$$

(B4) Second rotation of normalization for 4-fold symmetric images,

$$\theta_2 = \frac{1}{4} \tan^{-1} \frac{I_{3,1}^{\langle s, \text{trs} \rangle} - I_{1,3}^{\langle s, \text{trs} \rangle}}{\left\{ \begin{aligned} & \left[\frac{1}{2} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right] I_{0,0}^{\langle s, \text{trs} \rangle} \\ & + \left[\frac{5}{4} K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} - \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - \frac{1}{4} K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} \right] \\ & \quad \times (I_{2,0}^{\langle s, \text{trs} \rangle} + I_{0,2}^{\langle s, \text{trs} \rangle}) \\ & + \frac{1}{4} K_{1,4}^{N_s, N_s} \times (I_{4,0}^{\langle s, \text{trs} \rangle} + I_{0,4}^{\langle s, \text{trs} \rangle}) - \frac{3}{2} K_{3,2}^{N_s, N_s} I_{2,2}^{\langle s, \text{trs} \rangle} \end{aligned} \right\}} \quad (6.38)$$

and

$$\begin{aligned} & \left[\frac{1}{2} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right] I_{0,0}^{\langle r_2, s, \text{trs} \rangle} \\ & + \left[\frac{5}{4} K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} - \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - \frac{1}{4} K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} \right] \\ & \quad \times (I_{2,0}^{\langle r_2, s, \text{trs} \rangle} + I_{0,2}^{\langle r_2, s, \text{trs} \rangle}) \\ & + \frac{1}{4} K_{1,4}^{N_s, N_s} (I_{4,0}^{\langle r_2, s, \text{trs} \rangle} + I_{0,4}^{\langle r_2, s, \text{trs} \rangle}) - \frac{3}{2} K_{3,2}^{N_s, N_s} I_{2,2}^{\langle r_2, s, \text{trs} \rangle} > 0. \end{aligned} \quad (6.39)$$

Proof. From Theorem 5.3.1, we can deduce the following invariant moments:

$$\begin{aligned} I_{2,1}^{\langle r_2, s, \text{trs} \rangle} &= -\frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle} \\ & \quad + \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle} \\ & \quad + \left\{ \cos(2\theta_2) \cos \theta_2 - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 \right\} I_{2,1}^{\langle s, \text{trs} \rangle} \\ & \quad + \left\{ \cos(2\theta_2) \sin \theta_2 + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 \right\} I_{1,2}^{\langle s, \text{trs} \rangle} \end{aligned} \quad (6.40)$$

$$\begin{aligned} I_{0,3}^{\langle r_2, s, \text{trs} \rangle} &= -\sin^3 \theta_2 I_{3,0}^{\langle s, \text{trs} \rangle} + \cos^3 \theta_2 I_{0,3}^{\langle s, \text{trs} \rangle} \\ & \quad + \frac{3}{2} \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} I_{2,1}^{\langle s, \text{trs} \rangle} \\ & \quad - \frac{3}{2} \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} I_{1,2}^{\langle s, \text{trs} \rangle} \end{aligned} \quad (6.41)$$

$$\begin{aligned}
I_{3,1}^{\langle r_2, s, \text{trs} \rangle} = & -\cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} I_{4,0}^{\langle s, \text{trs} \rangle} + \sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} I_{0,4}^{\langle s, \text{trs} \rangle} \\
& + \cos(3\theta_2) \cos \theta_2 I_{3,1}^{\langle s, \text{trs} \rangle} + \sin(3\theta_2) \sin \theta_2 I_{1,3}^{\langle s, \text{trs} \rangle} \\
& + \frac{3}{4} \sin(4\theta_2) K_{3,2}^{N_s, N_s} I_{2,2}^{\langle s, \text{trs} \rangle} \\
& + \left\{ \cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin^3 \theta_2 \cos \theta_2 \right. \\
& \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[-\frac{3}{2} \cos^2 \theta_2 + \sin^2 \theta_2 \right] \right\} I_{2,0}^{\langle s, \text{trs} \rangle} \\
& + \left\{ -\sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin \theta_2 \cos^3 \theta_2 \right. \\
& \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[\frac{3}{2} \sin^2 \theta_2 - \cos^2 \theta_2 \right] \right\} I_{0,2}^{\langle s, \text{trs} \rangle} \\
& + \sin(4\theta_2) \left\{ -\frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} + \frac{1}{2} K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right\} I_{0,0}^{\langle s, \text{trs} \rangle} \quad (6.42)
\end{aligned}$$

and

$$\begin{aligned}
I_{1,3}^{\langle r_2, s, \text{trs} \rangle} = & -\sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} I_{4,0}^{\langle s, \text{trs} \rangle} + \cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} I_{0,4}^{\langle s, \text{trs} \rangle} \\
& + \sin(3\theta_2) \sin \theta_2 I_{3,1}^{\langle s, \text{trs} \rangle} + \cos(3\theta_2) \cos \theta_2 I_{1,3}^{\langle s, \text{trs} \rangle} \\
& + \frac{3}{4} K_{3,2}^{N_s, N_s} \sin(4\theta_2) I_{2,2}^{\langle s, \text{trs} \rangle} \\
& + \left\{ \sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - \frac{1}{2} \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin(2\theta_2) \cos^2 \theta_2 \right. \\
& \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[-\frac{3}{2} \sin^2 \theta_2 + \cos^2 \theta_2 \right] \right\} I_{2,0}^{\langle s, \text{trs} \rangle} \\
& + \left\{ -\cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + \frac{1}{2} \sin(2\theta_2) \sin^2 \theta_2 K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} \right. \\
& \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[\frac{3}{2} \cos^2 \theta_2 - \sin^2 \theta_2 \right] \right\} I_{0,2}^{\langle s, \text{trs} \rangle} \\
& + \sin(4\theta_2) \left\{ \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - \frac{1}{2} K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right\} I_{0,0}^{\langle s, \text{trs} \rangle}. \quad (6.43)
\end{aligned}$$

Consider

$$\begin{aligned}
I_{2,1}^{\langle r_2, s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{0,3}^{\langle r_2, s, \text{trs} \rangle} = & -\sin \theta_2 \left[I_{1,2}^{\langle s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle} \right] \\
& + \cos \theta_2 \left[I_{2,1}^{\langle s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle} \right]. \quad (6.44)
\end{aligned}$$

Suppose

$$I_{2,1}^{\langle r_2, s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{0,3}^{\langle r_2, s, \text{trs} \rangle} = 0 \quad (6.45)$$

we get

$$\theta_2 = \tan^{-1} \left\{ \frac{I_{2,1}^{\langle s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle}}{I_{1,2}^{\langle s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle}} \right\}. \quad (6.46)$$

Similar to the principal axis normalization, ambiguity of the normalization can be resolved by restricting the expression of the denominator after transformation to be a positive number, i.e.

$$I_{1,2}^{\langle r_2, s, \text{trs} \rangle} + K_{1,3}^{N_s, N_s} I_{3,0}^{\langle r_2, s, \text{trs} \rangle} > 0. \quad (6.47)$$

Experimental results show that the expression is accurate for non-symmetric and 1-fold symmetric images. However in general, this rotation normalization scheme is applicable to any image provided that the numerator and denominator of (6.46) are both non-zero, or both not smaller than a preassigned threshold value.

For the second rotation normalization of 2-fold symmetric images, we consider

$$\begin{aligned} I_{3,1}^{\langle r_2, s, \text{trs} \rangle} + I_{1,3}^{\langle r_2, s, \text{trs} \rangle} &= \sin(2\theta_2) \left\{ \frac{1}{2} \left[-K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \right. \\ &\quad \times \left(I_{0,2}^{\langle s, \text{trs} \rangle} - I_{2,0}^{\langle s, \text{trs} \rangle} \right) \\ &\quad \left. + \frac{1}{2} K_{1,4}^{N_s, N_s} \left(I_{0,4}^{\langle s, \text{trs} \rangle} - I_{4,0}^{\langle s, \text{trs} \rangle} \right) \right\} \\ &\quad + \cos(2\theta_2) \left\{ I_{3,1}^{\langle s, \text{trs} \rangle} + I_{1,3}^{\langle s, \text{trs} \rangle} \right\} \end{aligned} \quad (6.48)$$

By having

$$I_{3,1}^{\langle r_2, s, \text{trs} \rangle} + I_{1,3}^{\langle r_2, s, \text{trs} \rangle} = 0, \quad (6.49)$$

we get

$$\theta_2 = \frac{1}{2} \tan^{-1} \frac{I_{3,1}^{\langle s, \text{trs} \rangle} + I_{1,3}^{\langle s, \text{trs} \rangle}}{\left\{ \frac{1}{2} \left[K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \right.} \quad (6.50)$$

$$\left. \times \left(I_{0,2}^{\langle s, \text{trs} \rangle} - I_{2,0}^{\langle s, \text{trs} \rangle} \right) - \frac{1}{2} K_{1,4}^{N_s, N_s} \left(I_{0,4}^{\langle s, \text{trs} \rangle} - I_{4,0}^{\langle s, \text{trs} \rangle} \right) \right\}$$

with the constraint

$$\begin{aligned} \frac{1}{2} \left[K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \times \left(I_{0,2}^{\langle r_2, s, \text{trs} \rangle} - I_{2,0}^{\langle r_2, s, \text{trs} \rangle} \right) \\ - \frac{1}{2} K_{1,4}^{N_s, N_s} \left(I_{0,4}^{\langle r_2, s, \text{trs} \rangle} - I_{4,0}^{\langle r_2, s, \text{trs} \rangle} \right) > 0. \end{aligned} \quad (6.51)$$

The second rotation normalization for 3-fold symmetric images is based on the following expression

$$\begin{aligned} I_{2,1}^{\langle r_2, s, \text{trs} \rangle} - \frac{1}{3} K_{1,3}^{N_s, N_s} I_{0,3}^{\langle r_2, s, \text{trs} \rangle} &= \sin(3\theta_2) \left(I_{1,2}^{\langle s, \text{trs} \rangle} - \frac{1}{3} K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle} \right) \\ &\quad + \cos(3\theta_2) \left(I_{2,1}^{\langle s, \text{trs} \rangle} - \frac{1}{3} K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle} \right). \end{aligned} \quad (6.52)$$

By having

$$I_{2,1}^{\langle r_2, s, \text{trs} \rangle} - \frac{1}{3} K_{1,2}^{N_s, N_s} I_{0,3}^{\langle r_2, s, \text{trs} \rangle} = 0, \quad (6.53)$$

we have

$$\theta_2 = \frac{1}{3} \tan^{-1} \left\{ \frac{\tilde{A}_1^{N_s} I_{0,3}^{\langle s, \text{trs} \rangle} - 3\tilde{A}_3^{N_s} I_{2,1}^{\langle s, \text{trs} \rangle}}{3\tilde{A}_3^{N_s} I_{1,2}^{\langle s, \text{trs} \rangle} - \tilde{A}_1^{N_s} I_{3,0}^{\langle s, \text{trs} \rangle}} \right\} \quad (6.54)$$

and the constraint

$$3\tilde{A}_3^{N_s} I_{1,2}^{\langle r_2, s, \text{trs} \rangle} - \tilde{A}_1^{N_s} I_{3,0}^{\langle r_2, s, \text{trs} \rangle} > 0. \quad (6.55)$$

Finally, we consider the second rotation normalization for 4-fold symmetric images

$$I_{3,1}^{\langle r_2, s, \text{trs} \rangle} - I_{1,3}^{\langle r_2, s, \text{trs} \rangle} = \sin(4\theta_2) \left\{ \begin{aligned} & \left[-\frac{1}{2} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} + K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right] I_{0,0}^{\langle s, \text{trs} \rangle} \\ & + \left[\frac{1}{4} K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - \frac{5}{4} K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \\ & \quad \times (I_{0,2}^{\langle s, \text{trs} \rangle} + I_{2,0}^{\langle s, \text{trs} \rangle}) + \frac{3}{2} K_{3,2}^{N_s, N_s} I_{2,2}^{\langle s, \text{trs} \rangle} \\ & - \frac{1}{4} K_{1,4}^{N_s, N_s} (I_{4,0}^{\langle s, \text{trs} \rangle} + I_{0,4}^{\langle s, \text{trs} \rangle}) \end{aligned} \right\} \quad (6.56)$$

$$+ \cos(4\theta_2) [I_{3,1}^{\langle s, \text{trs} \rangle} - I_{1,3}^{\langle s, \text{trs} \rangle}] \quad (6.57)$$

By having

$$I_{3,1}^{\langle r_2, s, \text{trs} \rangle} - I_{1,3}^{\langle r_2, s, \text{trs} \rangle} = 0, \quad (6.58)$$

we get

$$\theta_2 = \frac{1}{4} \tan^{-1} \frac{I_{3,1}^{\langle s, \text{trs} \rangle} - I_{1,3}^{\langle s, \text{trs} \rangle}}{\left\{ \begin{aligned} & \left[\frac{1}{2} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right] I_{0,0}^{\langle s, \text{trs} \rangle} \\ & + \left[\frac{5}{4} K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} - \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - \frac{1}{4} K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} \right] \\ & \quad \times (I_{2,0}^{\langle s, \text{trs} \rangle} + I_{0,2}^{\langle s, \text{trs} \rangle}) \\ & + \frac{1}{4} K_{1,4}^{N_s, N_s} \times (I_{4,0}^{\langle s, \text{trs} \rangle} + I_{0,4}^{\langle s, \text{trs} \rangle}) - \frac{3}{2} K_{3,2}^{N_s, N_s} I_{2,2}^{\langle s, \text{trs} \rangle} \end{aligned} \right\}} \quad (6.59)$$

and ambiguities are resolved by

$$\begin{aligned} & \left[\frac{1}{2} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right] I_{0,0}^{\langle r_2, s, \text{trs} \rangle} \\ & + \left[\frac{5}{4} K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} - \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_3^{N_s} - \frac{1}{4} K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} \right] \\ & \quad \times (I_{2,0}^{\langle r_2, s, \text{trs} \rangle} + I_{0,2}^{\langle r_2, s, \text{trs} \rangle}) \\ & + \frac{1}{4} K_{1,4}^{N_s, N_s} (I_{4,0}^{\langle r_2, s, \text{trs} \rangle} + I_{0,4}^{\langle r_2, s, \text{trs} \rangle}) - \frac{3}{2} K_{3,2}^{N_s, N_s} I_{2,2}^{\langle r_2, s, \text{trs} \rangle} > 0. \end{aligned} \quad (6.60)$$

□

6.2.6 Reflection Invariants

The mirror reflection can be resolved by using the following constraint

$$I_{2,1}^{(l, r_2, s, \text{trs})} \geq 0 \quad (6.61)$$

where $I_{n,m}^{(l, r_2, s, \text{trs})}$ denotes the Tchebichef moment after the TRS, stretching, second rotation, and mirror reflection normalization.

6.3 Experimental Results

In this experiment a set of non-symmetric images and a set of symmetric images with 1-fold symmetric up to 4-fold symmetric are selected. Each pattern was deformed successively by the following transformations

$$\begin{pmatrix} a_1 & a_2 \\ b_1 & b_2 \end{pmatrix} = \begin{pmatrix} 1 & 0 \\ 0 & z \end{pmatrix} \begin{pmatrix} \cos \rho & \sin \rho \\ -\sin \rho & \cos \rho \end{pmatrix} \begin{pmatrix} \omega & 0 \\ 0 & \omega \end{pmatrix} \begin{pmatrix} \delta & 0 \\ 0 & \frac{1}{\delta} \end{pmatrix} \begin{pmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{pmatrix} \quad (6.62)$$

where z denotes the reflective deformation with value ± 1 . The coefficients ω and δ are parameters for uniform scale and stretch deformation respectively. Together they form non-uniform scaling. On the other hand α and ρ are the angles for first and second rotation deformation, respectively. Finally the deformed images are translated from the middle of the space by values of $\{-5, 0, 1\}$. Together they form the affine deformation. The parameter values are randomly selected to emulate various type of deformations. The deformed images are shown in Tables 6.1 and 6.2. In the experiment, for non-symmetric images and 1-fold symmetric image "B", the first second rotation algorithms is deployed. For 2-fold image symmetric image, "H" the second rotation algorithms given by (6.34) and (6.35) are used in the experiment. The company logo of Mitsubishi is 3-fold symmetrical and the third second rotation algorithm is used. Finally the "box" is a 4-fold symmetric image and the forth second rotation is deployed. The selected feature values of non-symmetric images and symmetric images are shown in Tables 6.3 and 6.4 , respectively. The result indicates that the propose normalization algorithms are able to accurately compute the affine invariant for the both types of images. Similar to normalization by AST and TRS, the odd order invariants with relatively small values are more vulnerable to discretization errors. This is mainly due to cancellation process of invariant transformation functions. The errors can be easily corrected by adding with the suitable

skew parameter values to the normalization process. Figure 6.1 denotes the canonical position of all the output images. It is generated by overlapping the output of all patterns of the same class. As shown in Figure 6.1, no ambiguity has been detected on the output images. This indicates that all the images are accurately transformed to their standard form without ambiguities.

Figure 6.1: Canonical positions of normalized images.

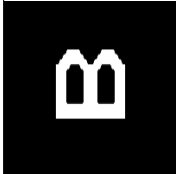

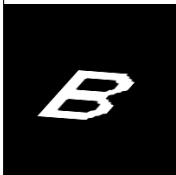

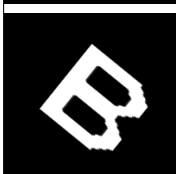

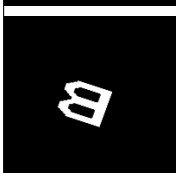

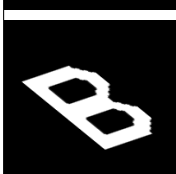

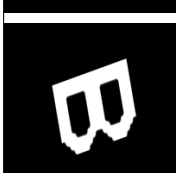

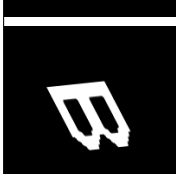

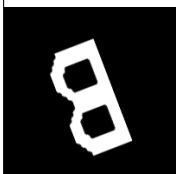

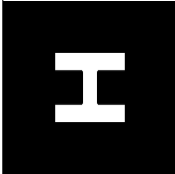

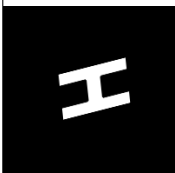

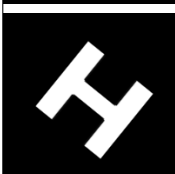

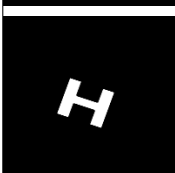

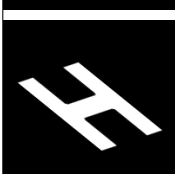

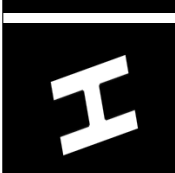

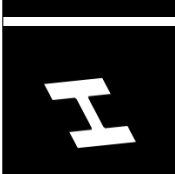

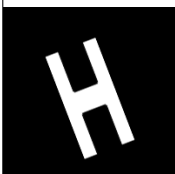

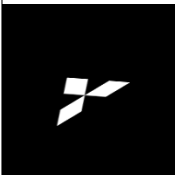

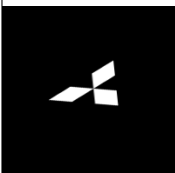

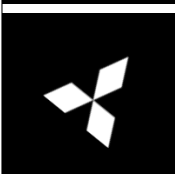

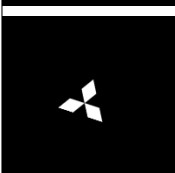

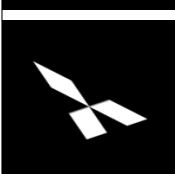

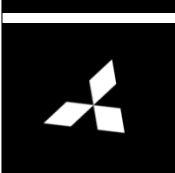

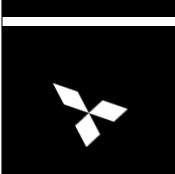

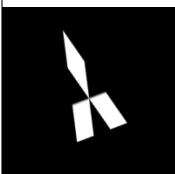

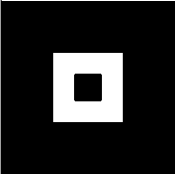

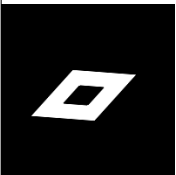

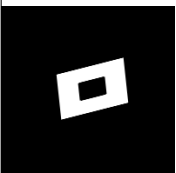

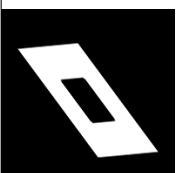

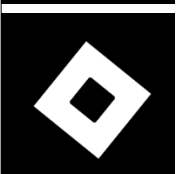

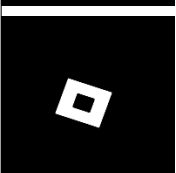

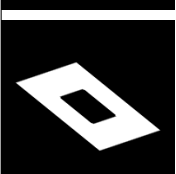

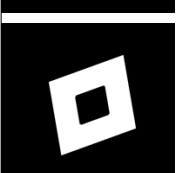

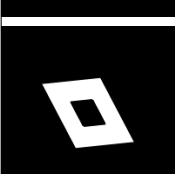

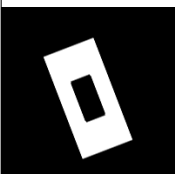

6.4 Conclusion

In this chapter a new set of affine Tchebichef moment invariants has been proposed. The invariant algorithm consists of a set of recurrence relations for fast computation and the normalization parameters are determined from the discrete Tchebichef moments. The experiment results show that the proposed normalization scheme can accurately normalized images of both non-symmetric and symmetric patterns.

CHAPTER 7

CONCLUSION AND FUTURE RESEARCH DIRECTIONS

7.1 Conclusions

Moment invariants are commonly used in image analysis to recognize patterns distorted by various spatial deformations. In this thesis, several invariant algorithms of discrete orthogonal moments have been studied. They are anisotropic scale and translation invariants, translation, rotation and scale invariants and affine invariants. New recurrence relation functions have been derived for fast computation of the invariant descriptors. These come together with new sets of normalization schemes to determine the normalization parameters from discrete domain so that the descriptors have better discriminative power and less sensitive to noise disturbance. Discrete Tchebichef moments are selected as the implementation platform for the invariant algorithms. This is mainly due to Tchebichef moments being global feature descriptors with unit weight function. The invariants can be accurately derived from original Tchebichef moments without any numerical approximation on the weight function itself.

In Chapter 2 a brief overview is given to moments and classification functions that have been used in this thesis.

In Chapter 3 two fast computational algorithms for the anisotropic scale and translation invariants of Zhu et al. (2007c) have been proposed. The first algorithm used an indirect approach from which the invariant descriptors are calculated indirectly from geometric moments. In the second algorithm, the features are directly computed from Tchebichef moments using the proposed recurrence relations.

Anisotropic scale and translation invariants can alternatively be achieved using image normalization approach. In Chapter 4 the existing algorithms have been reviewed (Goh et al., 2009; Liu et al., 2011) and they are found to be numerically inferior. Thus a new set of recurrence relations has been derived for fast computation of the invariants moments. This comes together with three new normalization schemes based on Tchebichef moments for determination of normalization parameters. The use of centre of symmetry

as centroid for the canonical image is crucial in preserving feature discriminative power. The experimental results showed that the new algorithms outperform existing methods from the aspect of numerical efficiency, robustness to noise and feature discriminative power.

In Chapter 5 the fast computational algorithms proposed in Chapter 4 are generalized further to solve the much more sophisticated problems - the affine Tchebichef transformation. This comes together with a new normalization scheme based on the Tchebichef moments. From that, a fast with high discriminative power TRS Tchebichef moments invariants have been derived.

In Chapter 6 new affine Tchebichef moment invariants that use the seven decomposition transformations of Flusser et al. (2009) have been proposed. For the proposed invariants, the initial seven decomposition transformations are combined and reduced to four transformations: TRS transformation, stretch transformation, second rotation transformation and reflective transformation. A new set of normalization schemes based on Tchebichef moments has been proposed to determine the normalization parameters. Four distinct normalization schemes have been derived for second rotation transformation to handle symmetric patterns with 1-fold symmetric up to 4-fold symmetric, respectively. With that the affine invariants are capable to accurately discriminate all non-symmetric patterns, as well as the symmetric patterns with 1-fold symmetry up to 4-fold symmetry.

7.2 Future Research Directions

There are many possibilities to extend current research project. Below are some ideas that are worth mentioning:

- **Chapters 3 to 6**

1. The definition of moments invariants $I_{n,m}^{(ast)}$, $I_{n,m}^{(trs)}$, and $I_{n,m}^{(am)}$ are based on the assumptions of canonical forms being in discrete domain and the invariants are derivable from the original moments. Despite ambiguities between the invariants of canonical form and the above assumption, the results of derivation is accurate for low order moment invariants. However insufficient study were conducted for higher order moment invariants. Therefore further study

on the moment invariants of higher orders would be helpful to understand the limitation and restriction in using the definition of the moment invariants.

2. Tchebichef moments as global features extractor, is bounded with the limitation of not being able to extract the local information in a particular region of an image. Krawtchouk and Hahn moments on the other hand having non-uniform weight kernel that can be used in extracting the local information. Therefore an extension of all the proposed invariant algorithms to other members of discrete orthogonal moments like Krawtchouk and Hahn moments would be very interesting and useful for the recognition system to extract local information of images which have been deformed by various type of spatial distortions.
3. One of the objectives of this thesis is to study the new normalization strategy and to generate moment invariant features with high discriminative power. Therefore further performance comparison on the proposed invariants with other family of moment invariants like Legendre moments and Zernike moments would be interesting to confirm the capability of the discrete orthogonal moment invariants.

• Chapter 6

1. Derivation of the second rotation transformation for the symmetric images with 5-fold symmetry and above would be very useful. Study on determining the number of symmetrical fold of images using Tchebichef moments is important to automate the selection process of the second rotation algorithm. However a theoretical study on second rotation transformation using a single set of normalization constraints for all types of images would be the greatest breakthrough for the method.
2. Recently Tchebichef based affine invariants XSR and YYS have been proposed by Liu et al. (2011). However the algorithms are complicated and slow in numerical computation. Therefore fast computation and new normalization strategy for the moment invariants would be very helpful.

Appendices

APPENDIX A

ANISOTROPIC SCALE AND TRANSLATION INVARIANTS OF LIU ET. AL.

The Tchebichef moments

$$I_{n,m}^{\langle \text{ast-L} \rangle} = \sum_{k=0}^n \sum_{j=0}^m \sum_{r=0}^k \sum_{s=0}^j \tilde{a}_1^{k+1} \tilde{b}_1^{j+1} c_{n,k}^N c_{m,j}^N d_{k,r}^N d_{j,s}^N T_{r,s}^{\langle c \rangle} \quad n, m = 0, 1, \dots, N-1. \quad (\text{A.1})$$

is anisotropic scale and translation invariants, if the scale parameters \tilde{a}_1 and \tilde{b}_1 are determined by the constraint

$$I_{2,0}^{\langle \text{ast-L} \rangle} = \Omega_L = I_{0,2}^{\langle \text{ast-L} \rangle} \quad \text{where} \quad \Omega_L \in \Re$$

or from solutions of the following system equations

$$\begin{aligned} (c_{2,2}^N d_{2,0}^N T_{0,0}^{\langle c \rangle} + c_{2,2}^N d_{2,1}^N T_{1,0}^{\langle c \rangle} + T_{2,0}^{\langle c \rangle}) \tilde{a}_1^3 \tilde{b}_1 + (c_{2,1}^N d_{1,0}^N T_{0,0}^{\langle c \rangle} \\ + c_{2,1}^N d_{1,1}^N T_{1,0}^{\langle c \rangle}) \tilde{a}_1^2 \tilde{b}_1 + (c_{2,0}^N d_{0,0}^N T_{0,0}^{\langle c \rangle}) \tilde{a}_1 \tilde{b}_1 = \Omega_L \end{aligned} \quad (\text{A.2})$$

$$\begin{aligned} (c_{2,2}^N d_{2,0}^N T_{0,0}^{\langle c \rangle} + c_{2,2}^N d_{2,1}^N T_{0,1}^{\langle c \rangle} + T_{0,2}^{\langle c \rangle}) \tilde{a}_1 \tilde{b}_1^3 + (c_{2,1}^N d_{1,0}^N T_{0,0}^{\langle c \rangle} \\ + c_{2,1}^N d_{1,1}^N T_{0,1}^{\langle c \rangle}) \tilde{a}_1 \tilde{b}_1^2 + (c_{2,0}^N d_{0,0}^N T_{0,0}^{\langle c \rangle}) \tilde{a}_1 \tilde{b}_1 = \Omega_L. \end{aligned} \quad (\text{A.3})$$

Proof. We review some formulations that will be used by the proof. From chapter 4, the image centroid has expressions

$$\bar{x} = \frac{c_{0,0}^N T_{1,0} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}} \quad \text{and} \quad \bar{y} = \frac{c_{0,0}^N T_{0,1} - c_{1,0}^N T_{0,0}}{c_{1,1}^N T_{0,0}} \quad (\text{A.4})$$

and

$$\sum_{k=m}^n c_{n,k}^N d_{k,m}^N = \delta_{n,m} \quad (\text{A.5})$$

where

$$x^n = \sum_{j=0}^n d_{n,j}^N \tilde{t}_k^N(x) \quad (\text{A.6})$$

$$t_n^N(x) = \sum_{k=0}^n c_{n,k}^N x^k, \quad x, n = 0, 1, \dots, N-1 \quad (\text{A.7})$$

and $\delta_{n,m}$ denotes the Kronecker's delta that returns unity when $n = m$ and zero otherwise.

We will now solve the equations of (A.2) and (A.3).

For simplicity, let

$$I_{2,0}^{\langle \text{ast-L} \rangle} = A_1 \tilde{a}_1^3 \tilde{b}_1 + A_2 \tilde{a}_1^2 \tilde{b}_1 + A_3 \tilde{a}_1 \tilde{b}_1 \text{ and} \quad (\text{A.8})$$

$$I_{0,2}^{\langle \text{ast-L} \rangle} = B_1 \tilde{a}_1 \tilde{b}_1^3 + B_2 \tilde{a}_1 \tilde{b}_1^2 + A_3 \tilde{a}_1 \tilde{b}_1 \quad (\text{A.9})$$

where

$$A_1 = c_{2,2}^N d_{2,0}^N T_{0,0}^{\langle c \rangle} + c_{2,2}^N d_{2,1}^N T_{1,0}^{\langle c \rangle} + T_{2,0}^{\langle c \rangle} \quad (\text{A.10})$$

$$A_2 = c_{2,1}^N d_{1,0}^N T_{0,0}^{\langle c \rangle} + c_{2,1}^N d_{1,1}^N T_{1,0}^{\langle c \rangle} \quad (\text{A.11})$$

$$A_3 = c_{2,0}^N d_{0,0}^N T_{0,0}^{\langle c \rangle} \quad (\text{A.12})$$

$$B_1 = c_{2,2}^N d_{2,0}^N T_{0,0}^{\langle c \rangle} + c_{2,2}^N d_{2,1}^N T_{0,1}^{\langle c \rangle} + T_{0,2}^{\langle c \rangle} \quad (\text{A.13})$$

$$B_2 = c_{2,1}^N d_{1,0}^N T_{0,0}^{\langle c \rangle} + c_{2,1}^N d_{1,1}^N T_{0,1}^{\langle c \rangle} \quad (\text{A.14})$$

The central transformed images having centroid at the origin. From (A.4), we get

$$c_{0,0}^N T_{1,0}^{\langle c \rangle} - c_{1,0}^N T_{0,0}^{\langle c \rangle} = 0 \quad (\text{A.15})$$

$$c_{0,0}^N T_{0,1} - c_{1,0}^N T_{0,0} = 0. \quad (\text{A.16})$$

With the help from (A.5), (A.15) and (A.16), we can deduce that $A_2 = B_2 = 0$. The expression (A.8) and (A.9) can thus be written as

$$I_{2,0}^{\langle \text{ast-L} \rangle} = A_1 \tilde{a}_1^3 \tilde{b}_1 + A_3 \tilde{a}_1 \tilde{b}_1, \text{ and} \quad (\text{A.17})$$

$$I_{0,2}^{\langle \text{ast-L} \rangle} = B_1 \tilde{a}_1 \tilde{b}_1^3 + A_3 \tilde{a}_1 \tilde{b}_1. \quad (\text{A.18})$$

From the given constraint $I_{2,0}^{\langle \text{ast-L} \rangle} = I_{0,2}^{\langle \text{ast-L} \rangle}$, we have

$$\tilde{a}_1 = \tilde{b}_1 \sqrt{\frac{B_1}{A_1}}. \quad (\text{A.19})$$

By using the constraint $I_{2,0}^{\langle \text{ast-L} \rangle} = \Omega_L = I_{0,2}^{\langle \text{ast-L} \rangle}$, (A.19) is finally solved as

$$\tilde{a}_1^2 = \frac{-A_3 \pm \sqrt{A_3^2 + 4\Omega_L \sqrt{A_1 B_1}}}{2A_1} \text{ and} \quad (\text{A.20})$$

$$\tilde{b}_1^2 = \frac{-A_3 \pm \sqrt{A_3^2 + 4\Omega_L \sqrt{A_1 B_1}}}{2B_1}. \quad (\text{A.21})$$

□

APPENDIX B

DERIVATION OF SECOND ORDER ANISOTROPIC SCALE AND TRANSLATED TCHEBICHEF MOMENT INVARIANTS

We need to show that the second order AST moments $I_{2,0}^{(ast)}$ and $I_{0,2}^{(ast)}$ have following expressions:

$$\begin{aligned} I_{2,0}^{(ast)} = & \left(\frac{N_0}{N_s} \right) a_1^3 b_1 \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{2,0} + 2 \left(\frac{N_0 - 1}{2} - \bar{x} \right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{1,0} + \right. \\ & \left. \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0 - 1}{2} - \bar{x} \right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\} \\ & + a_1 b_1 \left(\frac{N_0}{N_s} \right) \tilde{C}_2^{N_s} T_{0,0} \end{aligned} \quad (B.1)$$

and

$$\begin{aligned} I_{0,2}^{(ast)} = & \left(\frac{N_0}{N_s} \right) a_1 b_1^3 \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{0,2} + 2 \left(\frac{N_0 - 1}{2} - \bar{y} \right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{0,1} + \right. \\ & \left. \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0 - 1}{2} - \bar{y} \right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\} \\ & + a_1 b_1 \left(\frac{N_0}{N_s} \right) \tilde{C}_2^{N_s} T_{0,0}. \end{aligned} \quad (B.2)$$

Suppose $f'(x', y') = f(x, y)$ denotes the AST transformed image f that

$$\begin{aligned} x' &= a_1 x - a_1 \bar{x} + \frac{N_s - 1}{2} \quad \text{and} \\ y' &= b_1 y - b_1 \bar{y} + \frac{N_s - 1}{2} \\ (x, y) &\in S_2(N_0), \text{ and } (x', y') \in S_2(N_s). \end{aligned} \quad (B.3)$$

In this case, the centroid of f' is on the middle of $S_2(N_s)$.

From Theorem 4.3.1, we have

$$I_{n,m}^{(ast)} = |a_1 b_1| \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)} \lambda_{m,j}^{(2)} T_{k,j} \quad (B.4)$$

where

$$\begin{aligned} \lambda_{n,k}^{(1)}(a_1, -a_1\bar{x} + \frac{Ns-1}{2}; N_0, N_s) &= \lambda_{n-1,k-1}^{(1)} a_1 K_{n,k}^{N_s, N_0} + \lambda_{n-1,k}^{(1)} a_1 \tilde{A}_n^{N_s} \left[\frac{(N_0-1)}{2} - \bar{x} \right] \\ &\quad - \lambda_{n-1,k+1}^{(1)} a_1 K_{n,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} + \lambda_{n-2,k}^{(1)} \tilde{C}_n^{N_s} \end{aligned} \quad (\text{B.5})$$

$$\begin{aligned} \lambda_{m,j}^{(2)}(b_1, -b_1\bar{y} + \frac{Ns-1}{2}; N_0, N_s) &= \lambda_{m-1,j-1}^{(2)} b_1 K_{m,j}^{N_s, N_0} + \lambda_{m-1,j}^{(2)} b_1 \tilde{A}_m^{N_s} \left[\frac{(N_0-1)}{2} - \bar{y} \right] \\ &\quad - \lambda_{m-1,j+1}^{(2)} b_1 K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} + \lambda_{m-2,j}^{(2)} \tilde{C}_m^{N_s}. \end{aligned} \quad (\text{B.6})$$

By using the recurrence relation we get

$$\lambda_{0,0}^{(1)} = \sqrt{\left(\frac{N_0}{N_s}\right)} \quad (\text{B.7})$$

$$\lambda_{1,1}^{(1)} = a_1 \sqrt{\left(\frac{N_0}{N_s}\right)} K_{1,1}^{N_s, N_0} \quad (\text{B.8})$$

$$\lambda_{1,0}^{(1)} = a_1 \tilde{A}_1^{N_s} \left[\frac{N_0-1}{2} - \bar{x} \right] \sqrt{\left(\frac{N_0}{N_s}\right)} \quad (\text{B.9})$$

$$\lambda_{2,2}^{(1)} = a_1^2 \sqrt{\left(\frac{N_0}{N_s}\right)} K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \quad (\text{B.10})$$

$$\lambda_{2,1}^{(1)} = 2a_1^2 \tilde{A}_2^{N_s} K_{1,1}^{N_s, N_0} \sqrt{\left(\frac{N_0}{N_s}\right)} \left[\frac{N_0-1}{2} - \bar{x} \right] \quad (\text{B.11})$$

$$\begin{aligned} \lambda_{2,0}^{(1)} &= a_1^2 \tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \sqrt{\left(\frac{N_0}{N_s}\right)} \left[\frac{N_0-1}{2} - \bar{x} \right]^2 \\ &\quad - a_1^2 K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \sqrt{\left(\frac{N_0}{N_s}\right)} + \sqrt{\left(\frac{N_0}{N_s}\right)} \tilde{C}_2^{N_s} \end{aligned} \quad (\text{B.12})$$

and

$$\lambda_{0,0}^{(2)} = \sqrt{\left(\frac{N_0}{N_s}\right)} \quad (\text{B.13})$$

$$\lambda_{1,1}^{(2)} = b_1 \sqrt{\left(\frac{N_0}{N_s}\right)} K_{1,1}^{N_s, N_0} \quad (\text{B.14})$$

$$\lambda_{1,0}^{(2)} = b_1 \tilde{A}_1^{N_s} \left[\frac{N_0-1}{2} - \bar{y} \right] \sqrt{\left(\frac{N_0}{N_s}\right)} \quad (\text{B.15})$$

$$\lambda_{2,2}^{(2)} = b_1^2 \sqrt{\left(\frac{N_0}{N_s}\right)} K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \quad (\text{B.16})$$

$$\lambda_{2,1}^{(2)} = 2b_1^2 \tilde{A}_2^{N_s} K_{1,1}^{N_s, N_0} \sqrt{\left(\frac{N_0}{N_s}\right)} \left[\frac{N_0-1}{2} - \bar{y} \right] \quad (\text{B.17})$$

$$\begin{aligned} \lambda_{2,0}^{(2)} &= b_1^2 \tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \sqrt{\left(\frac{N_0}{N_s}\right)} \left[\frac{N_0-1}{2} - \bar{y} \right]^2 \\ &\quad - b_1^2 K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \sqrt{\left(\frac{N_0}{N_s}\right)} + \sqrt{\left(\frac{N_0}{N_s}\right)} \tilde{C}_2^{N_s}. \end{aligned} \quad (\text{B.18})$$

From (B.10), (B.11), (B.12) and (B.13) we have

$$\begin{aligned}
I_{2,0}^{(\text{ast})} &= \left(\frac{N_0}{N_s}\right) a_1^3 b_1 \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{2,0} + 2 \left(\frac{N_0-1}{2} - \bar{x}\right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{1,0} \right. \\
&\quad \left. + \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0-1}{2} - \bar{x}\right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\} \\
&\quad + a_1 b_1 \left(\frac{N_0}{N_s}\right) \tilde{C}_2^{N_s} T_{0,0}.
\end{aligned} \tag{B.19}$$

Similarly, from (B.16), (B.17), (B.18) and (B.7) we get

$$\begin{aligned}
I_{0,2}^{(\text{ast})} &= \left(\frac{N_0}{N_s}\right) a_1 b_1^3 \left\{ K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} T_{0,2} + 2 \left(\frac{N_0-1}{2} - \bar{y}\right) \tilde{A}_1^{N_s} K_{2,1}^{N_s, N_0} T_{0,1} \right. \\
&\quad \left. + \left[\tilde{A}_1^{N_s} \tilde{A}_2^{N_s} \left(\frac{N_0-1}{2} - \bar{y}\right)^2 - K_{1,1}^{N_s, N_0} K_{2,2}^{N_s, N_0} \tilde{C}_2^{N_0} \right] T_{0,0} \right\} \\
&\quad + a_1 b_1 \left(\frac{N_0}{N_s}\right) \tilde{C}_2^{N_s} T_{0,0}.
\end{aligned} \tag{B.20}$$

APPENDIX C

TRANSLATION AND ROTATION TCHEBICHEF MOMENT INVARIANTS OF ZHANG ET. AL.

Translation and rotational invariants of Tchebichef moments by Zhang et.al. (2010) can be derived as follow

$$I_{n,m}^{\langle \text{tr-Z} \rangle} = \sum_{k=0}^n \sum_{j=0}^m \sum_{s=0}^k \sum_{t=0}^m \sum_{u=0}^{s+t} \sum_{v=0}^{k+j-s-t} \binom{k}{s} \binom{j}{t} (-1)^t \times (\cos \theta_z)^{j+s-t} (\sin \theta_z)^{k+t-s} c_{n,k}^N c_{m,j}^N d_{s+t,u}^N d_{j+k-s-t,v}^N T_{u,v}^{\langle c \rangle} \quad (\text{C.1})$$

where

$$\theta_z = \frac{1}{2} \tan^{-1} \left(\frac{p T_{1,1}^{\langle c \rangle} - q T_{0,0}^{\langle c \rangle}}{T_{2,0}^{\langle c \rangle} - T_{0,2}^{\langle c \rangle}} \right) \quad p = \frac{2c_{2,2}^N c_{0,0}^N}{(c_{1,1}^N)^2} \quad q = \frac{2c_{2,2}^N (c_{1,0}^N)^2}{c_{0,0}^N (c_{1,1}^N)^2}. \quad (\text{C.2})$$

and $T_{n,m}^{\langle c \rangle}$ denotes the Tchebichef central moment.

Here we want to show that the rotation invariants is equivalent to the constraint of

$$I_{1,1}^{\langle \text{tr-Z} \rangle} - \left(\frac{c_{1,0}^N}{c_{0,0}^N} \right)^2 I_{0,0}^{\langle \text{tr-Z} \rangle} = 0. \quad (\text{C.3})$$

Proof. We review some of the equations required by the proof. From Chapter 5, the centroid has expressions

$$\bar{x} = \frac{c_{0,0}^N T_{1,0}^{\langle c \rangle} - c_{1,0}^N T_{0,0}^{\langle c \rangle}}{c_{1,1}^N T_{0,0}^{\langle c \rangle}} \quad \text{and} \quad \bar{y} = \frac{c_{0,0}^N T_{0,1}^{\langle c \rangle} - c_{1,0}^N T_{0,0}^{\langle c \rangle}}{c_{1,1}^N T_{0,0}^{\langle c \rangle}} \quad (\text{C.4})$$

and

$$\sum_{k=m}^n c_{n,k}^N d_{k,m}^N = \delta_{n,m} \quad (\text{C.5})$$

where

$$x^n = \sum_{j=0}^n d_{n,j}^N \tilde{t}_k^N(x) \quad (\text{C.6})$$

$$t_n^N(x) = \sum_{k=0}^n c_{n,k}^N x^k, \quad x, n = 0, 1, \dots, N-1 \quad (\text{C.7})$$

and $\delta_{n,m}$ denotes the Kronecker's delta that return unity when $n = m$ and zero otherwise.

From (C.1), we can deduce that

$$\begin{aligned}
I_{1,1}^{\langle \text{tr-Z} \rangle} &= (c_{1,0}^N)^2 (d_{0,0}^N)^2 T_{0,0}^{\langle c \rangle} \\
&+ c_{1,0}^N c_{1,1}^N d_{0,0}^N \left\{ \cos \theta_z [2d_{1,0}^N T_{0,0}^{\langle c \rangle} + d_{1,1}^N T_{1,0}^{\langle c \rangle} + d_{1,1}^N T_{0,1}^{\langle c \rangle}] \right. \\
&\quad \left. + \sin \theta_z [-d_{1,1}^N T_{1,0}^{\langle c \rangle} + d_{1,1}^N T_{0,1}^{\langle c \rangle}] \right\} \\
&+ \frac{(c_{1,1}^N)^2}{2} d_{0,0}^N \sin(2\theta_z) \left\{ -\sum_{k=0}^2 d_{2,k}^N T_{k,0}^{\langle c \rangle} + \sum_{j=0}^2 d_{2,j}^N T_{0,j}^{\langle c \rangle} \right\} \\
&+ (c_{1,1}^N)^2 \cos(2\theta_z) \left\{ \sum_{k=0}^1 \sum_{j=0}^1 d_{1,k}^N d_{1,j}^N T_{k,j}^{\langle c \rangle} \right\}. \tag{C.8}
\end{aligned}$$

As centroid of Tchebichef central moments is at the origin, from (C.4), we get

$$c_{0,0}^N T_{1,0}^{\langle c \rangle} = c_{1,0}^N T_{0,0}^{\langle c \rangle} \tag{C.9}$$

$$c_{0,0}^N T_{0,1}^{\langle c \rangle} = c_{1,0}^N T_{0,0}^{\langle c \rangle}. \tag{C.10}$$

By using (C.9), (C.10) and (C.5), the equation (C.8) can be simplified as such

$$\begin{aligned}
I_{1,1}^{\langle \text{tr-Z} \rangle} - \left(\frac{c_{1,0}^N}{c_{0,0}^N} \right)^2 I_{0,0}^{\langle \text{tr-Z} \rangle} &= \cos(2\theta_z) \left[T_{1,1}^{\langle c \rangle} - \left(\frac{c_{1,0}^N}{c_{0,0}^N} \right)^2 T_{0,0}^{\langle c \rangle} \right] \\
&+ \sin(2\theta_z) \frac{(c_{1,1}^N)^2}{2c_{0,0}^N c_{2,2}^N} [T_{0,2}^{\langle c \rangle} - T_{2,0}^{\langle c \rangle}]. \tag{C.11}
\end{aligned}$$

Therefore the theorem is proved. \square

APPENDIX D

DERIVATION OF SECOND ORDER TRANSLATION, ROTATION AND SCALE TCHEBICHEF MOMENT INVARIANTS

From chapter 5, TRS-invariants have expression

$$I_{n,m}^{(\text{trs})} = \omega^2 \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \lambda_{n,m,k,j}^{(\text{trs})} T_{k,j} \quad n, m \in \{0, 1, \dots, \min\{N_0 - 1, N_s - 1\}\} \quad (\text{D.1})$$

where

$$\lambda_{n,m,k,j}^{(\text{trs})} = \lambda_{n,m,k,j} \left(\begin{array}{c} \omega \cos \theta, \quad \omega \sin \theta, \\ -\omega \bar{x} \cos \theta - \omega \bar{y} \sin \theta + \frac{N_s-1}{2}; \\ -\omega \sin \theta, \quad \omega \cos \theta, \\ \omega \bar{x} \sin \theta - \omega \bar{y} \cos \theta + \frac{N_s-1}{2} \end{array} \middle| N_0, N_s \right) \quad (\text{D.2})$$

and the scale coefficients ω is determined by

$$\omega = \sqrt{\frac{\Omega_0 N_s^2}{T_{0,0} N_0}} \quad (\text{D.3})$$

where Ω_0 is the ratio between the mass of canonical form and the space $N_s \times N_s$.

The recurrence relations of the TRS-invariant are

$$\begin{aligned} \lambda_{n,m,k,j}^{(\text{trs})} = & -\lambda_{n-1,m,k+1,j}^{(\text{trs})} \omega \cos \theta K_{n,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n-1,m,k,j+1}^{(\text{trs})} \omega \sin \theta K_{n,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n-1,m,k,j}^{(\text{trs})} \omega \tilde{A}_n^{N_s} \left[\cos \theta \left(\frac{N_0-1}{2} - \bar{x} \right) + \sin \theta \left(\frac{N_0-1}{2} - \bar{y} \right) \right] \\ & + \lambda_{n-1,m,k-1,j}^{(\text{trs})} \omega \cos \theta K_{n,k}^{N_s, N_0} + \lambda_{n-1,m,k,j-1}^{(\text{trs})} \omega \sin \theta K_{n,k}^{N_s, N_0} \\ & + \lambda_{n-2,m,k,j}^{(\text{trs})} \tilde{C}_n^{N_s} \end{aligned} \quad (\text{D.4})$$

and

$$\begin{aligned} \lambda_{n,m,k,j}^{(\text{trs})} = & \lambda_{n,m-1,k+1,j}^{(\text{trs})} \omega \sin \theta K_{m,k+2}^{N_s, N_0} \tilde{C}_{k+2}^{N_0} - \lambda_{n,m-1,k,j+1}^{(\text{trs})} \omega \cos \theta K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_0} \\ & + \lambda_{n,m-1,k,j}^{(\text{trs})} \omega \tilde{A}_m^{N_s} \left[-\sin \theta \left(\frac{N_0-1}{2} - \bar{x} \right) + \cos \theta \left(\frac{N_0-1}{2} - \bar{y} \right) \right] \\ & - \lambda_{n,m-1,k-1,j}^{(\text{trs})} \omega \sin \theta K_{m,k}^{N_s, N_0} + \lambda_{n,m-1,k,j-1}^{(\text{trs})} \omega \cos \theta K_{m,j}^{N_s, N_0} \\ & + \lambda_{n,m-2,k,j}^{(\text{trs})} \tilde{C}_m^{N_s}. \end{aligned} \quad (\text{D.5})$$

We will now derive $\lambda_{n,m,k,j}^{\langle \text{trs} \rangle}$ recursively.

For $(n, m) = (0, 0)$,

$$\lambda_{0,0,0,0}^{\langle \text{trs} \rangle} = \left(\frac{N_0}{N_s} \right) \quad (\text{D.6})$$

and $(n, m) = (1, 0)$,

$$\lambda_{1,0,1,0}^{\langle \text{trs} \rangle} = \omega \cos \theta K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.7})$$

$$\lambda_{1,0,0,1}^{\langle \text{trs} \rangle} = \omega \sin \theta K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.8})$$

$$\lambda_{1,0,0,0}^{\langle \text{trs} \rangle} = \omega \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left\{ \cos \theta \left(\frac{N_0 - 1}{2} - \bar{x} \right) + \sin \theta \left(\frac{N_0 - 1}{2} - \bar{y} \right) \right\}. \quad (\text{D.9})$$

For $(n, m) = (0, 1)$,

$$\lambda_{0,1,1,0}^{\langle \text{trs} \rangle} = -\omega \sin \theta K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.10})$$

$$\lambda_{0,1,0,1}^{\langle \text{trs} \rangle} = \omega \cos \theta K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.11})$$

$$\lambda_{0,1,0,0}^{\langle \text{trs} \rangle} = \omega \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s} \right) \left\{ -\sin \theta \left(\frac{N_0 - 1}{2} - \bar{x} \right) + \cos \theta \left(\frac{N_0 - 1}{2} - \bar{y} \right) \right\} \quad (\text{D.12})$$

and $(n, m) = (1, 1)$

$$\lambda_{1,1,2,0}^{\langle \text{trs} \rangle} = -\frac{\omega^2}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.13})$$

$$\lambda_{1,1,0,2}^{\langle \text{trs} \rangle} = \frac{\omega^2}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \quad (\text{D.14})$$

$$\lambda_{1,1,1,1}^{\langle \text{trs} \rangle} = \omega^2 \cos(2\theta) \left(K_{1,1}^{N_s, N_0} \right)^2 \left(\frac{N_0}{N_s} \right) \quad (\text{D.15})$$

$$\lambda_{1,1,1,0}^{\langle \text{trs} \rangle} = \omega^2 \tilde{A}_1^{N_s} K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \left\{ -\sin(2\theta) \left(\frac{N_0 - 1}{2} - \bar{x} \right) + \cos(2\theta) \left(\frac{N_0 - 1}{2} - \bar{y} \right) \right\} \quad (\text{D.16})$$

$$\lambda_{1,1,0,1}^{\langle \text{trs} \rangle} = \omega^2 \tilde{A}_1^{N_s} K_{1,1}^{N_s, N_0} \left(\frac{N_0}{N_s} \right) \left\{ \cos(2\theta) \left(\frac{N_0 - 1}{2} - \bar{x} \right) + \sin(2\theta) \left(\frac{N_0 - 1}{2} - \bar{y} \right) \right\} \quad (\text{D.17})$$

$$\lambda_{1,1,0,0}^{\langle \text{trs} \rangle} = \omega^2 \left(\tilde{A}_1^{N_s} \right)^2 \left(\frac{N_0}{N_s} \right) \left\{ \cos(2\theta) \left(\frac{N_0 - 1}{2} - \bar{x} \right) \left(\frac{N_0 - 1}{2} - \bar{y} \right) + \frac{1}{2} \sin(2\theta) \left[-\left(\frac{N_0 - 1}{2} - \bar{x} \right)^2 + \left(\frac{N_0 - 1}{2} - \bar{y} \right)^2 \right] \right\} \quad (\text{D.18})$$

From (D.13) to (D.18), we thus get

$$\begin{aligned}
I_{1,1}^{\langle \text{trs} \rangle} &= \sum_{k=0}^2 \sum_{j=0}^{2-k} \lambda_{1,1,k,j}^{\langle \text{trs} \rangle} T_{k,j} \\
&= \left\{ \begin{aligned} &\frac{1}{2} \sin(2\theta) \left[-\left(\frac{N_0-1}{2} - \bar{x}\right)^2 + \left(\frac{N_0-1}{2} - \bar{y}\right)^2 \right] \\ &+ \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \left(\frac{N_0-1}{2} - \bar{y}\right) \end{aligned} \right\} \times \omega^2 \left(\tilde{A}_1^{N_s}\right)^2 \left(\frac{N_0}{N_s}\right) T_{0,0} \\
&\quad + K_{1,1}^{N_s, N_0} \omega^2 \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s}\right) \left\{ \begin{aligned} &-\sin(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \\ &+ \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{y}\right) \end{aligned} \right\} T_{1,0} \\
&\quad + K_{1,1}^{N_s, N_0} \omega^2 \tilde{A}_1^{N_s} \left(\frac{N_0}{N_s}\right) \left\{ \begin{aligned} &\sin(2\theta) \left(\frac{N_0-1}{2} - \bar{y}\right) \\ &+ \cos(2\theta) \left(\frac{N_0-1}{2} - \bar{x}\right) \end{aligned} \right\} T_{0,1} \\
&\quad + \cos(2\theta) \left(\frac{N_0}{N_s}\right) \left(K_{1,1}^{N_s, N_0}\right)^2 \omega^2 T_{1,1} \\
&\quad - \frac{1}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \omega^2 \left(\frac{N_0}{N_s}\right) T_{2,0} \\
&\quad + \frac{1}{2} \sin(2\theta) K_{1,1}^{N_s, N_0} K_{1,2}^{N_s, N_0} \omega^2 \left(\frac{N_0}{N_s}\right) T_{0,2}.
\end{aligned} \tag{D.19}$$

APPENDIX E

DERIVATION OF TCHEBICHEF MOMENTS FOR STRETCH NORMALIZATION

The stretch normalization of a TRS transformed image can be express as

$$x' = \delta x + \delta \bar{x} + \frac{N_s - 1}{2} \quad \text{and} \quad (\text{E.1})$$

$$y' = \frac{1}{\delta} y + \frac{1}{\delta} \bar{y} + \frac{N_s - 1}{2} \quad (\text{E.2})$$

where $\bar{x} = \bar{y} = \frac{N_s - 1}{2}$.

From Theorem 4.3.1, the stretched and TRS normalized Tchebichef moment is

$$I_{n,m}^{(s, \text{trs})} = \sum_{k=0}^n \sum_{j=0}^m \lambda_{n,k}^{(1)} \lambda_{m,j}^{(2)} I_{k,j}^{(\text{trs})} \quad (\text{E.3})$$

where

$$\begin{aligned} \lambda_{n,k}^{(1)} \left(\delta, -\delta \bar{x} + \frac{N_s - 1}{2}; N_s, N_s \right) &= \lambda_{n-1,k-1}^{(1)} \delta K_{n,k}^{N_s, N_s} - \lambda_{n-1,k+1}^{(1)} \delta K_{n,k+2}^{N_s, N_s} \tilde{C}_{k+2}^{N_s} \\ &\quad + \lambda_{n-2,k}^{(1)} \tilde{C}_n^{N_s} \quad \text{and} \end{aligned} \quad (\text{E.4})$$

$$\begin{aligned} \lambda_{m,j}^{(2)} \left(\frac{1}{\delta}, -\frac{1}{\delta} \bar{y} + \frac{N_s - 1}{2}; N_s, N_s \right) &= \lambda_{m-1,j-1}^{(2)} \frac{1}{\delta} K_{m,j}^{N_s, N_s} - \lambda_{m-1,j+1}^{(2)} \frac{1}{\delta} K_{m,j+2}^{N_s, N_s} \tilde{C}_{j+2}^{N_s} \\ &\quad + \lambda_{m-2,j}^{(2)} \tilde{C}_m^{N_s}. \end{aligned} \quad (\text{E.5})$$

By using (E.4), we get

$$\lambda_{0,0}^{(1)} = 1 \quad (\text{E.6})$$

$$\lambda_{1,1}^{(1)} = \delta \quad (\text{E.7})$$

$$\lambda_{2,2}^{(1)} = \delta^2 \quad (\text{E.8})$$

$$\lambda_{2,0}^{(1)} = \tilde{C}_2^{N_s} (1 - \delta^2) \quad (\text{E.9})$$

$$\lambda_{1,0}^{(1)} = \lambda_{2,1}^{(1)} = 0. \quad (\text{E.10})$$

From (E.5), we get

$$\lambda_{0,0}^{(2)} = 1 \quad (\text{E.11})$$

$$\lambda_{1,1}^{(2)} = \frac{1}{\delta} \quad (\text{E.12})$$

$$\lambda_{2,2}^{(2)} = \left(\frac{1}{\delta}\right)^2 \quad (\text{E.13})$$

$$\lambda_{2,0}^{(2)} = \tilde{C}_2^{N_s} \left[1 - \left(\frac{1}{\delta}\right)^2 \right] \quad (\text{E.14})$$

$$\lambda_{1,0}^{(2)} = \lambda_{2,1}^{(2)} = 0. \quad (\text{E.15})$$

By (E.6) to (E.10) and (E.11) we get

$$I_{2,0}^{\langle s, \text{trs} \rangle} = \delta^2 I_{2,0}^{\langle \text{trs} \rangle} + \tilde{C}_2^{N_s} (1 - \delta^2) I_{0,0}^{\langle \text{trs} \rangle}. \quad (\text{E.16})$$

Similarly, from (E.6) and (E.11) to (E.15) we have

$$I_{0,2}^{\langle s, \text{trs} \rangle} = \left(\frac{1}{\delta^2}\right) I_{0,2}^{\langle \text{trs} \rangle} + \tilde{C}_2^{N_s} \left[1 - \left(\frac{1}{\delta^2}\right) \right] I_{0,0}^{\langle \text{trs} \rangle}. \quad (\text{E.17})$$

APPENDIX F

DERIVATION OF TCHEBICHEF MOMENTS USED IN SECOND ROTATION TRANSFORMATION

In the proof of 2nd rotational invariants, the following moments are required:

$$I_{2,1}^{\langle r_2, s, \text{trs} \rangle}, I_{0,3}^{\langle r_2, s, \text{trs} \rangle}, I_{1,3}^{\langle r_2, s, \text{trs} \rangle}, \text{ and } I_{3,1}^{\langle r_2, s, \text{trs} \rangle} \quad (\text{F.1})$$

From Theorem 5.3.1, the recurrence relation for the second rotation can be expressed as

$$I_{n,m}^{\langle r_2, s, \text{trs} \rangle} = \sum_{k=0}^{n+m} \sum_{j=0}^{n+m-k} \lambda_{n,m,k,j}^{\langle r_2 \rangle} I_{k,j}^{\langle s, \text{trs} \rangle} \quad (\text{F.2})$$

where the recurrence relation of coefficient $\lambda_{n,m,k,j}^{\langle r_2 \rangle}$ has two different expressions in directions of row and column, respectively.

$$\begin{aligned} \lambda_{n,m,k,j}^{\langle r_2 \rangle} & \left(\begin{array}{c} \cos \theta_2, \sin \theta_2, \frac{(N_s-1)}{2}(1 - \cos \theta_2 - \sin \theta_2) \\ -\sin \theta_2, \cos \theta_2, \frac{(N_s-1)}{2}(1 + \sin \theta_2 - \cos \theta_2) \end{array} \middle| N_s, N_s \right) \\ & = -\lambda_{n-1,m,k+1,j}^{\langle r_2 \rangle} \cos \theta_2 K_{n,k+2}^{N_s, N_s} \tilde{C}_{k+2}^{N_s} - \lambda_{n-1,m,k,j+1}^{\langle r_2 \rangle} \sin \theta_2 K_{n,j+2}^{N_s, N_s} \tilde{C}_{j+2}^{N_s} \\ & \quad + \lambda_{n-1,m,k-1,j}^{\langle r_2 \rangle} \cos \theta_2 K_{n,k}^{N_s, N_s} + \lambda_{n-1,m,k,j-1}^{\langle r_2 \rangle} \sin \theta_2 K_{n,j}^{N_s, N_s} \\ & \quad + \lambda_{n-2,m,k,j}^{\langle r_2 \rangle} \tilde{C}_n^{N_s} \end{aligned} \quad (\text{F.3})$$

and

$$\begin{aligned} \lambda_{n,m,k,j}^{\langle r_2 \rangle} & \left(\begin{array}{c} \cos \theta_2, \sin \theta_2, \frac{(N_s-1)}{2}(1 - \cos \theta_2 - \sin \theta_2) \\ -\sin \theta_2, \cos \theta_2, \frac{(N_s-1)}{2}(1 + \sin \theta_2 - \cos \theta_2) \end{array} \middle| N_s, N_s \right) \\ & = \lambda_{n,m-1,k+1,j}^{\langle r_2 \rangle} \sin \theta_2 K_{m,k+2}^{N_s, N_s} \tilde{C}_{k+2}^{N_s} - \lambda_{n,m-1,k,j+1}^{\langle r_2 \rangle} \cos \theta_2 K_{m,j+2}^{N_s, N_0} \tilde{C}_{j+2}^{N_s} \\ & \quad - \lambda_{n,m-1,k-1,j}^{\langle r_2 \rangle} \sin \theta_2 K_{m,k}^{N_s, N_s} + \lambda_{n,m-1,k,j-1}^{\langle r_2 \rangle} \cos \theta_2 K_{m,j}^{N_s, N_s} \\ & \quad + \lambda_{n,m-2,k,j}^{\langle r_2 \rangle} \tilde{C}_m^{N_s}. \end{aligned} \quad (\text{F.4})$$

From (F.3) and (F.4), we can deduce the following recursively
for $n + m \leq 1$,

$$\lambda_{0,0,0,0}^{\langle r_2 \rangle} = 1 \quad (\text{F.5})$$

$$\lambda_{1,0,1,0}^{\langle r_2 \rangle} = \cos \theta_2 \quad (\text{F.6})$$

$$\lambda_{1,0,0,1}^{\langle r_2 \rangle} = \sin \theta_2 \quad (\text{F.7})$$

$$\lambda_{0,1,1,0}^{\langle r_2 \rangle} = -\sin \theta_2 \quad (\text{F.8})$$

$$\lambda_{0,1,0,1}^{\langle r_2 \rangle} = \cos \theta_2 \quad (\text{F.9})$$

$$\lambda_{1,0,0,0}^{\langle r_2 \rangle} = \lambda_{0,1,0,0}^{\langle r_2 \rangle} = 0. \quad (\text{F.10})$$

For $n + m = 2$, we have that

$$\lambda_{2,0,2,0}^{\langle r_2 \rangle} = \cos^2 \theta_2 \quad (\text{F.11})$$

$$\lambda_{2,0,1,1}^{\langle r_2 \rangle} = \sin(2\theta_2) K_{2,1}^{N_s, N_s} \quad (\text{F.12})$$

$$\lambda_{2,0,0,2}^{\langle r_2 \rangle} = \sin^2 \theta_2 \quad (\text{F.13})$$

$$\lambda_{2,0,1,0}^{\langle r_2 \rangle} = \lambda_{2,0,0,1}^{\langle r_2 \rangle} = \lambda_{2,0,0,0}^{\langle r_2 \rangle} = 0. \quad (\text{F.14})$$

$$\lambda_{1,1,2,0}^{\langle r_2 \rangle} = -\frac{1}{2} \sin(2\theta_2) K_{1,2}^{N_s, N_s} \quad (\text{F.15})$$

$$\lambda_{1,1,1,1}^{\langle r_2 \rangle} = \cos(2\theta_2) \quad (\text{F.16})$$

$$\lambda_{1,1,0,2}^{\langle r_2 \rangle} = \frac{1}{2} \sin(2\theta_2) K_{1,2}^{N_s, N_s} \quad (\text{F.17})$$

$$\lambda_{1,1,1,0}^{\langle r_2 \rangle} = \lambda_{1,1,0,1}^{\langle r_2 \rangle} = \lambda_{1,1,0,0}^{\langle r_2 \rangle} = 0. \quad (\text{F.18})$$

And

$$\lambda_{0,2,2,0}^{\langle r_2 \rangle} = \sin^2 \theta_2 \quad (\text{F.19})$$

$$\lambda_{0,2,1,1}^{\langle r_2 \rangle} = -\sin(2\theta_2) K_{2,1}^{N_s, N_s} \quad (\text{F.20})$$

$$\lambda_{0,2,0,2}^{\langle r_2 \rangle} = \cos^2 \theta_2 \quad (\text{F.21})$$

$$\lambda_{0,2,1,0}^{\langle r_2 \rangle} = \lambda_{0,2,0,1}^{\langle r_2 \rangle} = \lambda_{0,2,0,0}^{\langle r_2 \rangle} = 0. \quad (\text{F.22})$$

For $n = 3, m = 0$

$$\lambda_{3,0,3,0}^{\langle r_2 \rangle} = \cos^3 \theta_2 \quad (F.23)$$

$$\lambda_{3,0,2,1}^{\langle r_2 \rangle} = \frac{3}{2} \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} \quad (F.24)$$

$$\lambda_{3,0,1,2}^{\langle r_2 \rangle} = \frac{3}{2} \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} \quad (F.25)$$

$$\lambda_{3,0,0,3}^{\langle r_2 \rangle} = \sin^3 \theta_2 \quad (F.26)$$

$$\lambda_{3,0,1,0}^{\langle r_2 \rangle} = \tilde{C}_3^{N_s} \cos \theta_2 \sin^2 \theta_2 - \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \quad (F.27)$$

$$\lambda_{3,0,0,1}^{\langle r_2 \rangle} = \tilde{C}_3^{N_s} \sin \theta_2 \cos^2 \theta_2 - \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \quad (F.28)$$

$$\lambda_{3,0,2,0}^{\langle r_2 \rangle} = \lambda_{3,0,1,1}^{\langle r_2 \rangle} = \lambda_{3,0,0,2}^{\langle r_2 \rangle} = \lambda_{3,0,0,0}^{\langle r_2 \rangle} = 0. \quad (F.29)$$

For $n = 2, m = 1$,

$$\lambda_{2,1,3,0}^{\langle r_2 \rangle} = -\frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} \quad (F.30)$$

$$\lambda_{2,1,2,1}^{\langle r_2 \rangle} = \cos(2\theta_2) \cos \theta_2 - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 \quad (F.31)$$

$$\lambda_{2,1,1,2}^{\langle r_2 \rangle} = \cos(2\theta_2) \sin \theta_2 + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 \quad (F.32)$$

$$\lambda_{2,1,0,3}^{\langle r_2 \rangle} = \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} \quad (F.33)$$

$$\lambda_{2,1,1,0}^{\langle r_2 \rangle} = -[\cos(2\theta_2) \sin \theta_2 + \sin \theta_2] \tilde{C}_2^{N_s} + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \quad (F.34)$$

$$\lambda_{2,1,0,1}^{\langle r_2 \rangle} = -[\cos(2\theta_2) \cos \theta_2 - \cos \theta_2] \tilde{C}_2^{N_s} - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \quad (F.35)$$

$$\lambda_{2,1,2,0}^{\langle r_2 \rangle} = \lambda_{2,1,1,1}^{\langle r_2 \rangle} = \lambda_{2,1,0,2}^{\langle r_2 \rangle} = \lambda_{2,1,0,0}^{\langle r_2 \rangle} = 0. \quad (F.36)$$

And $n = 1, m = 2$,

$$\lambda_{1,2,3,0}^{\langle r_2 \rangle} = \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} \quad (F.37)$$

$$\lambda_{1,2,2,1}^{\langle r_2 \rangle} = -\cos(2\theta_2) \sin \theta_2 - \frac{1}{2} \sin(2\theta_2) \cos \theta_2 \quad (F.38)$$

$$\lambda_{1,2,1,2}^{\langle r_2 \rangle} = \cos(2\theta_2) \cos \theta_2 - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 \quad (F.39)$$

$$\lambda_{1,2,0,3}^{\langle r_2 \rangle} = \frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} \quad (F.40)$$

$$\lambda_{1,2,1,0}^{\langle r_2 \rangle} = -[\cos(2\theta_2) \cos \theta_2 - \cos \theta_2] \tilde{C}_2^{N_s} - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \quad (F.41)$$

$$\lambda_{1,2,0,1}^{\langle r_2 \rangle} = [\cos(2\theta_2) \sin \theta_2 + \sin \theta_2] \tilde{C}_2^{N_s} - \frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \quad (F.42)$$

$$\lambda_{1,2,2,0}^{\langle r_2 \rangle} = \lambda_{1,2,1,1}^{\langle r_2 \rangle} = \lambda_{1,2,0,2}^{\langle r_2 \rangle} = \lambda_{1,2,0,0}^{\langle r_2 \rangle} = 0. \quad (F.43)$$

When $n = 0, m = 3$, we get

$$\lambda_{0,3,3,0}^{\langle r_2 \rangle} = -\sin^3 \theta_2 \quad (\text{F.44})$$

$$\lambda_{0,3,2,1}^{\langle r_2 \rangle} = \frac{3}{2} \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} \quad (\text{F.45})$$

$$\lambda_{0,3,1,2}^{\langle r_2 \rangle} = -\frac{3}{2} \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} \quad (\text{F.46})$$

$$\lambda_{0,3,0,3}^{\langle r_2 \rangle} = \cos^3 \theta_2 \quad (\text{F.47})$$

$$\lambda_{0,3,1,0}^{\langle r_2 \rangle} = \sin(2\theta_2) \cos \theta_2 \left(-\frac{1}{2} \tilde{C}_3^{N_s} + K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \right) \quad (\text{F.48})$$

$$\lambda_{0,3,0,1}^{\langle r_2 \rangle} = \sin(2\theta_2) \sin \theta_2 \left(\frac{1}{2} \tilde{C}_3^{N_s} - K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \right) \quad (\text{F.49})$$

$$\lambda_{0,3,2,0}^{\langle r_2 \rangle} = \lambda_{0,3,1,1}^{\langle r_2 \rangle} = \lambda_{0,3,0,2}^{\langle r_2 \rangle} = \lambda_{0,3,0,0}^{\langle r_2 \rangle} = 0. \quad (\text{F.50})$$

For $n = 3, m = 1$,

$$\lambda_{3,1,4,0}^{\langle r_2 \rangle} = -\cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \quad (\text{F.51})$$

$$\lambda_{3,1,3,1}^{\langle r_2 \rangle} = \cos(3\theta_2) \cos \theta_2 \quad (\text{F.52})$$

$$\lambda_{3,1,3,0}^{\langle r_2 \rangle} = \lambda_{3,1,2,1}^{\langle r_2 \rangle} = \lambda_{3,1,1,2}^{\langle r_2 \rangle} = \lambda_{3,1,0,3}^{\langle r_2 \rangle} = \lambda_{3,1,1,1}^{\langle r_2 \rangle} = \lambda_{3,1,1,0}^{\langle r_2 \rangle} = \lambda_{3,1,0,1}^{\langle r_2 \rangle} = 0. \quad (\text{F.59})$$

For $n = 1, m = 3$,

$$\lambda_{1,3,4,0}^{\langle r_2 \rangle} = -\sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} \quad (F.60)$$

$$\lambda_{1,3,3,1}^{\langle r_2 \rangle} = \sin(3\theta_2) \sin \theta_2 \quad (F.61)$$

$$\lambda_{1,3,2,2}^{\langle r_2 \rangle} = -\frac{3}{4} K_{3,2}^{N_s, N_s} \sin(4\theta_2) \quad (F.62)$$

$$\lambda_{1,3,1,3}^{\langle r_2 \rangle} = \cos(3\theta_2) \cos \theta_2 \quad (F.63)$$

$$\lambda_{1,3,0,4}^{\langle r_2 \rangle} = \cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \quad (F.64)$$

$$\begin{aligned} \lambda_{1,3,2,0}^{\langle r_2 \rangle} = & \sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - \frac{1}{2} \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin(2\theta_2) \cos^2 \theta_2 \\ & + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[-\frac{3}{2} \sin^2 \theta_2 + \cos^2 \theta_2 \right] \end{aligned} \quad (F.65)$$

$$\begin{aligned} \lambda_{1,3,0,2}^{\langle r_2 \rangle} = & -\cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + \frac{1}{2} \sin(2\theta_2) \sin^2 \theta_2 \tilde{C}_3^{N_s} \\ & + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[\frac{3}{2} \cos^2 \theta_2 - \sin^2 \theta_2 \right] \end{aligned} \quad (F.66)$$

$$\lambda_{1,3,0,0}^{\langle r_2 \rangle} = \sin(4\theta_2) \left\{ \frac{1}{4} K_{1,2}^{N_s, N_s} \tilde{C}_2^{N_s} \tilde{C}_3^{N_s} - \frac{1}{2} K_{3,2}^{N_s, N_s} (\tilde{C}_2^{N_s})^2 \right\} \quad (F.67)$$

$$\lambda_{1,3,3,0}^{\langle r_2 \rangle} = \lambda_{1,3,2,1}^{\langle r_2 \rangle} = \lambda_{1,3,1,2}^{\langle r_2 \rangle} = \lambda_{1,3,0,3}^{\langle r_2 \rangle} = \lambda_{1,3,1,1}^{\langle r_2 \rangle} = \lambda_{1,3,1,0}^{\langle r_2 \rangle} = \lambda_{1,3,0,1}^{\langle r_2 \rangle} = 0. \quad (F.68)$$

From (F.30 – F.36), we have

$$\begin{aligned} I_{2,1}^{\langle r_2, s, \text{trs} \rangle} = & -\frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle} \\ & + \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle} \\ & + \left\{ \cos(2\theta_2) \cos \theta_2 - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 \right\} I_{2,1}^{\langle s, \text{trs} \rangle} \\ & + \left\{ \cos(2\theta_2) \sin \theta_2 + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 \right\} I_{1,2}^{\langle s, \text{trs} \rangle} \\ & + \left\{ -[\cos(2\theta_2) \sin \theta_2 + \sin \theta_2] \tilde{C}_2^{N_s} \right. \\ & \quad \left. + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \right\} I_{1,0}^{\langle s, \text{trs} \rangle} \\ & - \left\{ [\cos(2\theta_2) \cos \theta_2 - \cos \theta_2] \tilde{C}_2^{N_s} \right. \\ & \quad \left. + \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} \tilde{C}_3^{N_s} \right\} I_{0,1}^{\langle s, \text{trs} \rangle} \end{aligned} \quad (F.69)$$

and from (F.44 – F.50) we get

$$\begin{aligned}
I_{0,3}^{\langle r_2, s, \text{trs} \rangle} &= -\sin^3 \theta_2 I_{3,0}^{\langle s, \text{trs} \rangle} + \cos^3 \theta_2 I_{0,3}^{\langle s, \text{trs} \rangle} \\
&\quad + \frac{3}{2} \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} I_{2,1}^{\langle s, \text{trs} \rangle} \\
&\quad - \frac{3}{2} \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} I_{1,2}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ \sin(2\theta_2) \cos \theta_2 \left[-\frac{1}{2} \tilde{C}_3^{N_s} + K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \right\} I_{1,0}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ \sin(2\theta_2) \sin \theta_2 \left[\frac{1}{2} \tilde{C}_3^{N_s} - K_{3,1}^{N_s, N_s} \tilde{C}_2^{N_s} \right] \right\} I_{0,1}^{\langle s, \text{trs} \rangle}. \tag{F.70}
\end{aligned}$$

As $I_{1,0}^{\langle s, \text{trs} \rangle} = I_{0,1}^{\langle s, \text{trs} \rangle} = 0$, the expressions of $I_{2,1}^{\langle s, \text{trs} \rangle}$ and $I_{0,3}^{\langle s, \text{trs} \rangle}$ can be further simplified.

We thus get

$$\begin{aligned}
I_{2,1}^{\langle r_2, s, \text{trs} \rangle} &= -\frac{1}{2} \sin(2\theta_2) \cos \theta_2 K_{1,3}^{N_s, N_s} I_{3,0}^{\langle s, \text{trs} \rangle} \\
&\quad + \frac{1}{2} \sin(2\theta_2) \sin \theta_2 K_{1,3}^{N_s, N_s} I_{0,3}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ \cos(2\theta_2) \cos \theta_2 - \frac{1}{2} \sin(2\theta_2) \sin \theta_2 \right\} I_{2,1}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ \cos(2\theta_2) \sin \theta_2 + \frac{1}{2} \sin(2\theta_2) \cos \theta_2 \right\} I_{1,2}^{\langle s, \text{trs} \rangle} \tag{F.71}
\end{aligned}$$

and

$$\begin{aligned}
I_{0,3}^{\langle r_2, s, \text{trs} \rangle} &= -\sin^3 \theta_2 I_{3,0}^{\langle s, \text{trs} \rangle} + \cos^3 \theta_2 I_{0,3}^{\langle s, \text{trs} \rangle} \\
&\quad + \frac{3}{2} \sin(2\theta_2) \sin \theta_2 K_{3,1}^{N_s, N_s} I_{2,1}^{\langle s, \text{trs} \rangle} \\
&\quad - \frac{3}{2} \sin(2\theta_2) \cos \theta_2 K_{3,1}^{N_s, N_s} I_{1,2}^{\langle s, \text{trs} \rangle}. \tag{F.72}
\end{aligned}$$

Similarly, by using (F.51 – F.59) and (F.60 – F.68), we get

$$\begin{aligned}
I_{3,1}^{\langle r_2, s, \text{trs} \rangle} &= -\cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} I_{4,0}^{\langle s, \text{trs} \rangle} + \sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} I_{0,4}^{\langle s, \text{trs} \rangle} \\
&\quad + \cos(3\theta_2) \cos \theta_2 I_{3,1}^{\langle s, \text{trs} \rangle} + \sin(3\theta_2) \sin \theta_2 I_{1,3}^{\langle s, \text{trs} \rangle} \\
&\quad + \frac{3}{4} \sin(4\theta_2) K_{3,2}^{N_s, N_s} I_{2,2}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ \cos^3 \theta_2 \sin \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} - \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin^3 \theta_2 \cos \theta_2 \right. \\
&\quad \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[-\frac{3}{2} \cos^2 \theta_2 + \sin^2 \theta_2 \right] \right\} I_{2,0}^{\langle s, \text{trs} \rangle} \\
&\quad + \left\{ -\sin^3 \theta_2 \cos \theta_2 K_{1,4}^{N_s, N_s} \tilde{C}_4^{N_s} + \tilde{C}_3^{N_s} K_{1,2}^{N_s, N_s} \sin \theta_2 \cos^3 \theta_2 \right. \\
&\quad \quad \left. + K_{3,2}^{N_s, N_s} \tilde{C}_2^{N_s} \sin(2\theta_2) \left[\frac{3}{2} \sin^2 \theta_2 - \cos^2 \theta_2 \right] \right\} I_{0,2}^{\langle s, \text{trs} \rangle} \\
